

Exploration Update

The Board of King River Copper wishes to advise that the 2016 exploration drilling at Speewah was completed over the weekend of 11th December 2016.

A total of 101 holes (for 6557 metres) have been drilled to test some previously known epithermal targets as well as some new features generated by a recent hand held magnetic survey.

The camp is currently being demobilised and drill samples will be trucked to Perth for assaying over the coming weeks.

After numerous mechanical issues with drill rigs, the Company greatly appreciates the efforts of our exploration team and contractors to complete the drill program in the face of such uncomfortable and threatening wet season circumstances.
