## AMENDED ANNOUNCEMENT ON DINNER HILL PHOSPHATE PROCESS DESIGN

**Note** this announcement is an amendment to the release of 31 August 2017. It contains more detail on the sample selection, a Table 1 on sampling techniques and competent person statements in relation to sample selection and mineral processing

### Highlights

- **Simpler flowsheet offers lower capital and operating costs**
- **Recoveries ranged from 52% to 68% at a range of concentrate grades between 15 and 20% P<sub>2</sub>O<sub>5</sub>, with 1 stage of flotation and without grinding**
- **Process improvements identified that should enhance both recovery and grade**

Parkway Minerals NL (“PWN”, “Parkway” or “the Company”) is pleased to announce the results of independent testwork carried out to enhance the Company’s phosphate fertiliser flowsheet for the Dinner Hill project.

Dinner Hill is the flagship of the Dandaragan Trough (Figure 1). Previous work had outlined a large resource of both phosphate and glauconite both of which can be used for the manufacture of fertiliser products (refer ASX announcement 3 June 2015).

Dinner Hill is located in an area of high quality infrastructure, close to rail and export ports. The development plan is to start mining to produce single superphosphate as stage 1 and use Parkways patented K-Max® process to produce sulphate of potash (SOP), high magnesium SOP, alum and phosphoric acid as stage 2. This reduces risk, capital requirements and shareholder dilution.

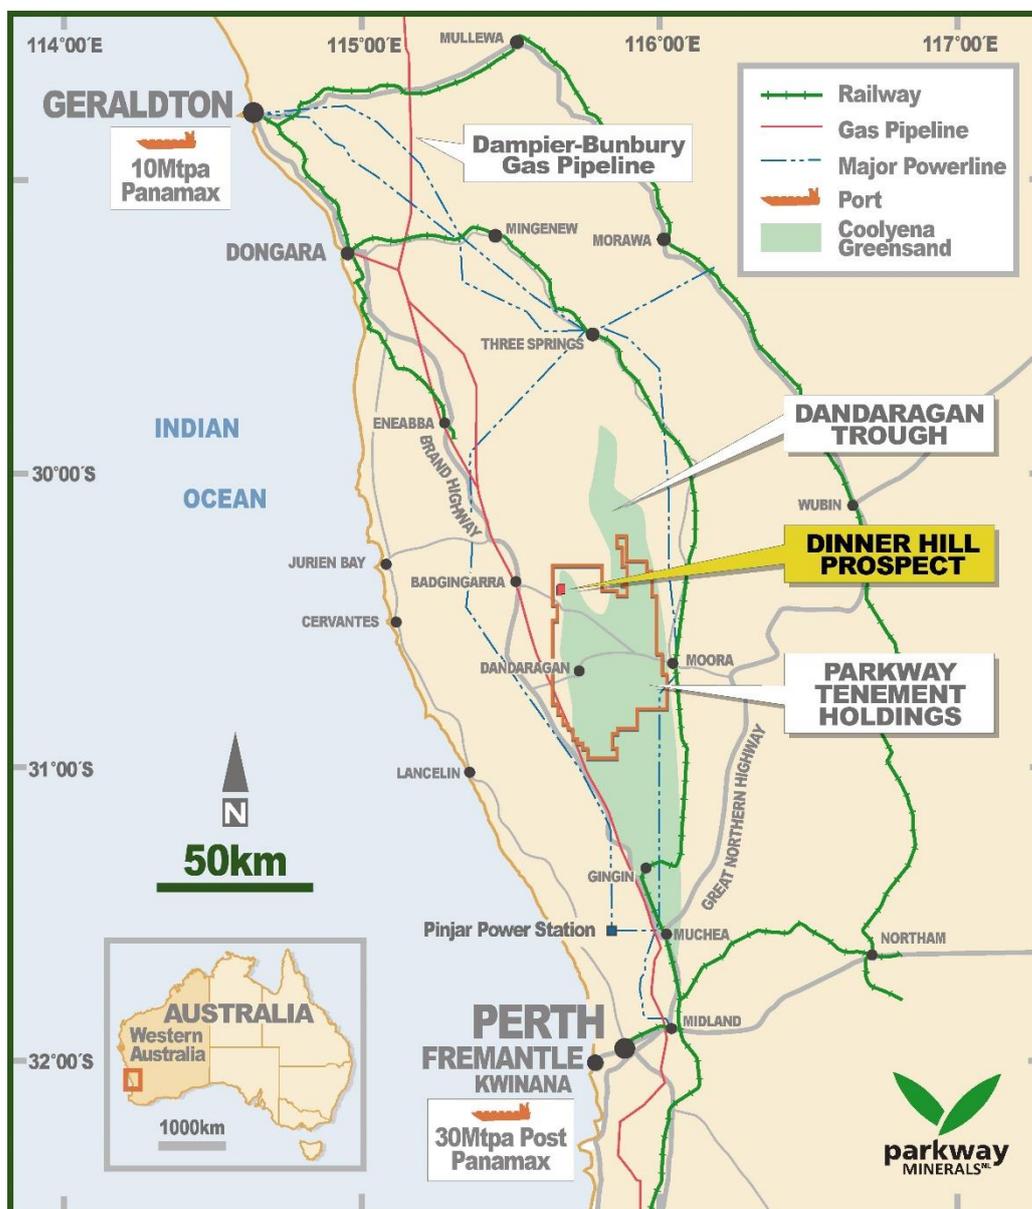

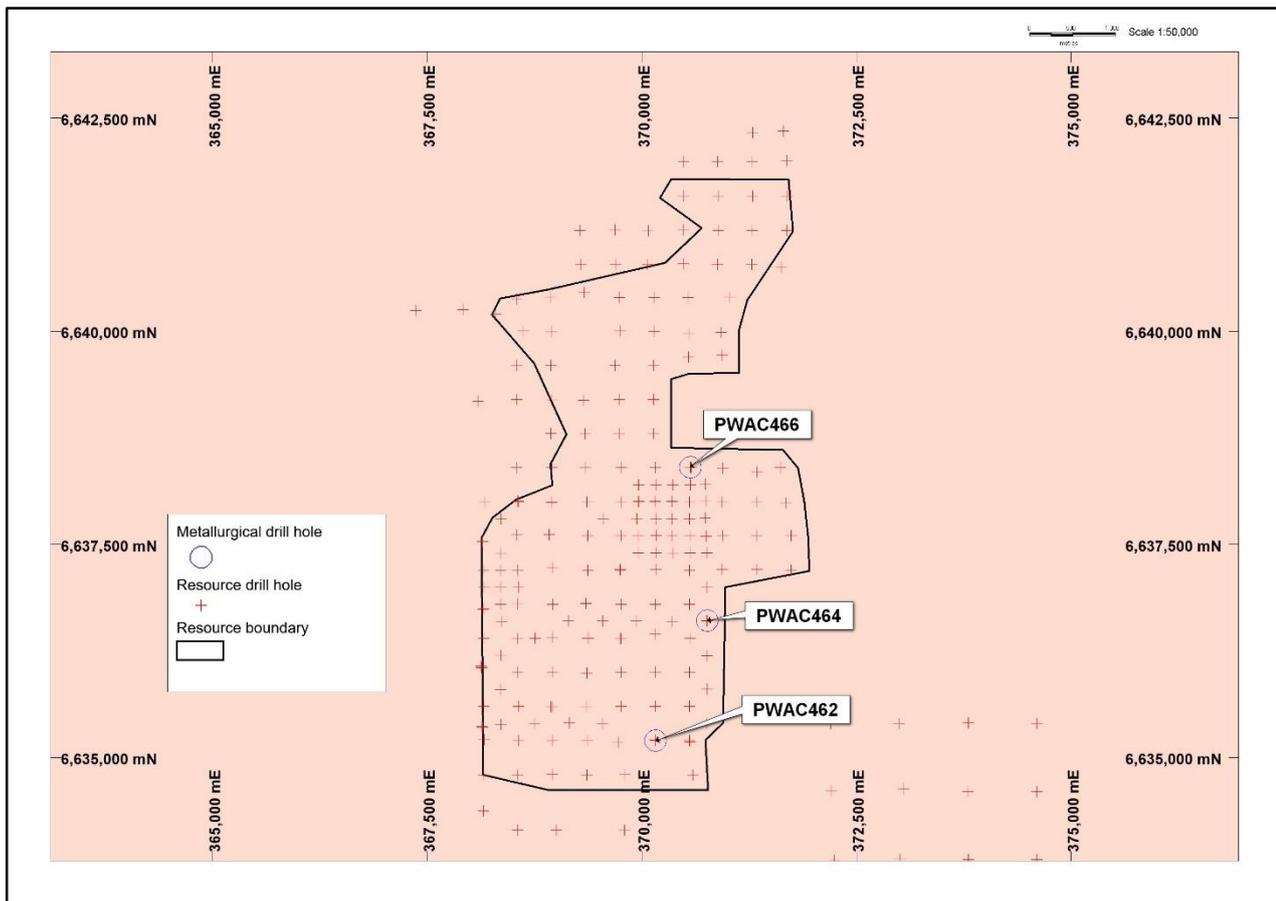

Figure 1: Dinner Hill Location

**Sample Selection**

A composite sample of Molecap Greensand weighing 104 kilograms was selected for independent metallurgical testwork. The composite was comprised of 12, 1m drill samples collected from three NQ air core drill holes located within the resource area, see Figure 2. Samples were collected over 1m intervals from the drill rig cyclone directly into polythene sample bags. Individual bags were secured and labelled and transported to storage areas by Company personnel.

The three metallurgical drill holes were drilled as twin holes located within 5m of a drill hole used in the Mineral Resource estimate. The twins, or metallurgical drill holes, were visually logged to confirm the target lithology. The metallurgical drill hole was not assayed by PWN. Assay data from the twinned resource drill hole was used to estimate the geochemistry of the metallurgical drill hole.

It is considered that the samples collected for the testwork are spatially and lithologically representative of the target horizon, the Molecap Greensand.

**Figure 2: Location of metallurgical drill holes**

### Dinner Hill Pre-Feasibility Testwork

As part of the Pre-Feasibility testwork for Dinner Hill the flowsheet developed as part of the Scoping Study was reviewed, and opportunities to improve the process flowsheet were identified.

Testwork was initiated with KEMWorks, based in Central Florida, USA. KEMWorks is a company that is focused on phosphate mining, processing and project development ( website: <http://kemworks.com>). The testwork was aimed at identifying process improvements that could lead to increased Separation Efficiency and/or cost reductions.

Unfortunately the composite provided to KEMWorks was lower grade than the majority of the phosphate mineralisation, which makes direct comparisons with some of the earlier testwork difficult. Typically a lower grade feed leads to a lower recovery and/or lower concentrate grade.

In the scoping study test work, (ASX release 30 September 2015 “Scoping Study Results”) the processing regime, developed by Perth based consultants, Strategic Metallurgy comprised:

- beneficiation,
- grinding and
- flotation (Coarse and fine circuits, 2 sets of Roughers, 3 sets of Cleaners, 3 sets of Scavengers),

which resulted in a product grade of 28% P<sub>2</sub>O<sub>5</sub>, with a recovery of 60% from a feed grade of 2.9% P<sub>2</sub>O<sub>5</sub>.

Test work at KEMWorks utilizing only beneficiation and a simpler flotation regime (rougher) on only part of the feed, produced a grade of between 15 and 21% P<sub>2</sub>O<sub>5</sub> with recoveries between 52 and 68%, from a feed grade

of 1.8% P<sub>2</sub>O<sub>5</sub>. The testwork successfully utilized attrition scrubbing, which is a low energy process, to clean the phosphate mineral surfaces of clays, break loose weak inclusions or attached particles of impurities, and break up aggregates of clay-rich material, whilst minimizing generation of fines, which have proved difficult to separate efficiently in earlier work.

Identified flowsheet improvements (not tested) include:

- Selective size reduction, of coarse fractions, to enhance liberation,
- Further cleaning flotation stages
- Further scavenger flotation stages
- Investigation of reverse flotation, a fairly standard treatment for phosphate flotation

**Parkway Managing Director, Patrick McManus said** “The achievement of this separation performance is a step forward for the Dinner Hill phosphate project. More than 50% of the phosphate was recovered by simple attritioning and screening at Imm, at a grade of 15 to 20% P<sub>2</sub>O<sub>5</sub>. Selective size reduction of this coarse fraction and selective cleaner/scavenger flotation to improve grades should allow an improved overall recovery, whilst meeting our final grade targets of +28% P<sub>2</sub>O<sub>5</sub>. Elimination, or significant reduction in size, of a grinding circuit will have a strong impact on both capital and operating costs”.

#### **Next steps**

Now we have identified areas where we should see a marked improvement in separation, a larger, and more representative sample will be used for further testwork to explore the process improvements identified.

#### **About Parkway Minerals**

*Parkway Minerals (ASX: PWN) is an exploration company focused on developing large greensand deposits in West Australia's Perth Basin. The Company aims to define a substantial resource base and investigate how best to recover phosphate, potash and other minerals from the Dandaragan Trough. The project is well situated in relation to infrastructure, with close access to rail, power and gas. A successful commercial outcome will allow the Company to become a major contributor to the potash and phosphate markets at a time of heightened regional demand.*

*The Company has a major land holding over one of the world's largest known glauconite deposits, with exploration licenses and applications covering an area of over 1,800km<sup>2</sup>. Previous exploration indicates glauconite sediments are widespread for more than 150km along strike and 30km in width. A pre-feasibility study is in progress for stage 1, production of phosphate fertilisers.*

*The company owns 26% of Davenport Resources, which owns a potash exploration project in the South Harz region of Thuringia, in Central Germany. The region has been a potash producing area for over 100 years.*

#### **Competent Person's Statements:**

*The information in this report that relates to exploration activities is based on information compiled by Lindsay Cahill, who is a member of the Australian Institute of Geoscientists. Mr. Cahill is a consultant to the mining*

*industry, and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration. He is qualified as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. This report is issued with Mr. Cahill's consent as to the form and context in which the exploration results appears.*

*The metallurgical information in this report relating to work done at KEMWorks is based on information compiled by Dr. Francisco J. Sotillo, CIP, PhD, who is a Member of SME and a Qualified Professional in Metallurgy/Processing of the Mining and Metallurgical Society of America (MMSA) under the National Instrument 43-101 (NI 43-101), Section 1.5. Dr. Sotillo has sufficient experience relevant to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Dr. Sotillo is a consultant to the mining industry and a consultant to KEMWorks. This report is issued with Dr. Sotillo's consent as to the form and context in which the results appear.*
