

30 March 2020

DRILLING RESULTS - TUMENTU PROSPECT, GHANA

Viking Mines Limited (ASX: VKA) (**Company**) has received the results for its aircore and reverse circulation drilling programme conducted in January 2020 on its Tumentu Prospect in Ghana.

The programme of thirty-five (35) holes totaling 1234.0m to an average depth of 34m, was to test previous soil sampling results.

The results were disappointing with some holes encountered patchy mineralization in places. Assays of 21 holes reported low grade intercepts of $>0.02\text{g/t Au}$. Only four holes assayed $+0.03\text{ g/t Au}$ with narrow zones of mineralization.

From the limited drilling data, the mineralization on the Tumentu prospect is indicated to be more structurally controlled. The holes drilled were very shallow and have not probed deep-seated structures that may control the mineralization within the Tumentu prospect.

The Board is considering the results and will consider the recommendation of the consulting geologist in regard to future work on the prospect.
