

26 April 2023

NT Minerals Activities Update

- **New Board initiates Strategic Exploration Review.**
- **Redbank Project's overall prospectivity receives boost from recent Geoscience Australia research release.**
- **Preliminary Findings from Strategic Exploration Review identifies 28 Gravity Targets.**
- **Identified Targets have responses similar to known mineralised breccia pipes.**

NT Minerals Limited (ASX: NTM) ('NT Minerals', 'NTM' or 'the Company') is pleased to provide an update of activities.

STRATEGIC EXPLORATION REVIEW

The Company under the direction of the new board has initiated a Strategic Exploration Review ('SER'). During the last three years NTM has established modern foundation datasets with significant work both regionally and locally. This includes extensive surface sampling, ground reconnaissance, airborne VTEM surveying, GAIP / DDIP & PDIP ground-based geophysics, magneto-telluric surveying, ground gravity, diamond and RC drilling over prospective stratigraphy testing local targets.

The SER will be undertaken over the next few months which will critically review all of these datasets. The review commenced with the acquisition of additional multi-element data for the most recent NTM drilling campaign complete in the 2022 season, which the company had not previously acquired. This data has been provided to an industry leading expert in the area of multi-element geochemistry and mineral systems for interpretation.

The Company looks forward to providing an update on the progress of the SER in the near future.

REDBANK PROJECT ENHANCED PROSPECTIVITY

The Company is greatly encouraged by the release of research in December 2022 derived from ground-breaking datasets originating from the "Exploring for the Future Program" or the EFTF program. This recent research identified a corridor with enhanced potential for base metal mineralisation, referred to as the North Australia Zinc Belt, it extends from the McArthur River Mine southeast to Century and Mount Isa along the 170 km lithospheric-asthenospheric (LAB) boundary (Figure 1).

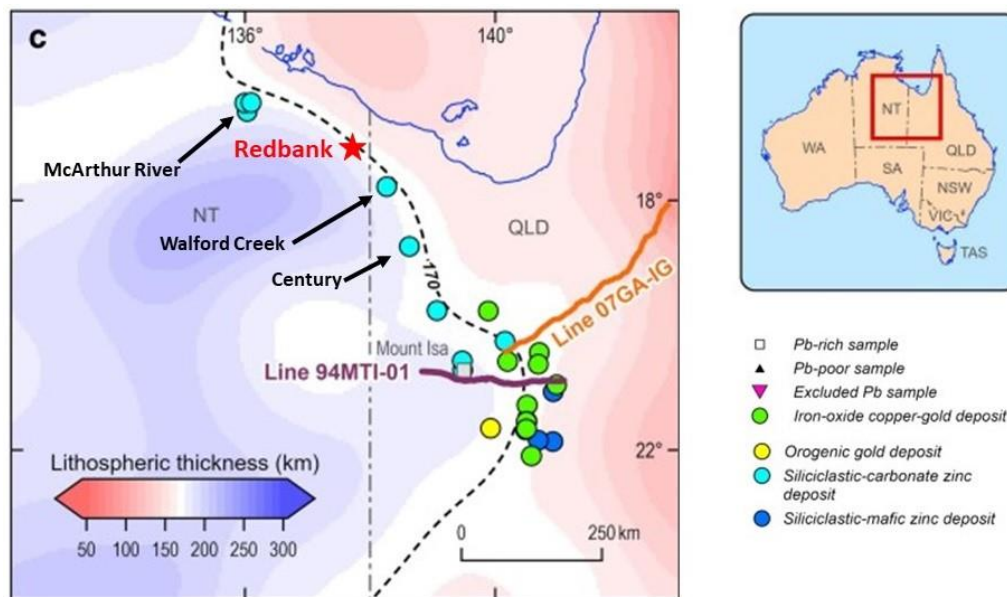

Figure 1: Map showing the 170km LAB with coincident zinc deposits (Hutson et al, 2022)

The Exploring for the Future Program was an initial four-year \$100 million federal funded program by Geoscience Australia ending in 2020. With collaborative efforts from the Northern Territory Geological Survey, the EFTF program provided new datasets to promote exploration in this covered highly prospective and underexplored region.

An initial output from the EFTF by Hoggard et al (2020) described the use of continent-scale scientific data to map mantle-edge thermal gradients along modern-day cratonic margins, identifying a change in the thickness of the lithosphere approximately 170 kilometres below surface, this change is interpreted to define craton margins not only in Australia (Figure 2) but across the world, noting **“85% of sediment-hosted base metals (copper, lead, zinc), including all giant deposits (>10 megatonnes of metal), occur within 200 km of the transition between thick and thin lithosphere”**, this 200km wide corridor is centred around the 170km LAB boundary line.

NTM’s project holdings straddle this interpreted boundary, importantly it should be noted that in addition to base metals other style of deposits have also been identified along this corridor (refer Figure 1).

Richards, S. Tessalina, G. Carr (2022). Zinc on the edge – isotopic and geophysical evidence that cratonic edges control world-class shale-hosted zinc-lead deposits, *Mineralium Deposita* (2023), 58:707–729. <https://doi.org/10.1007/s00126-022-01153-9>

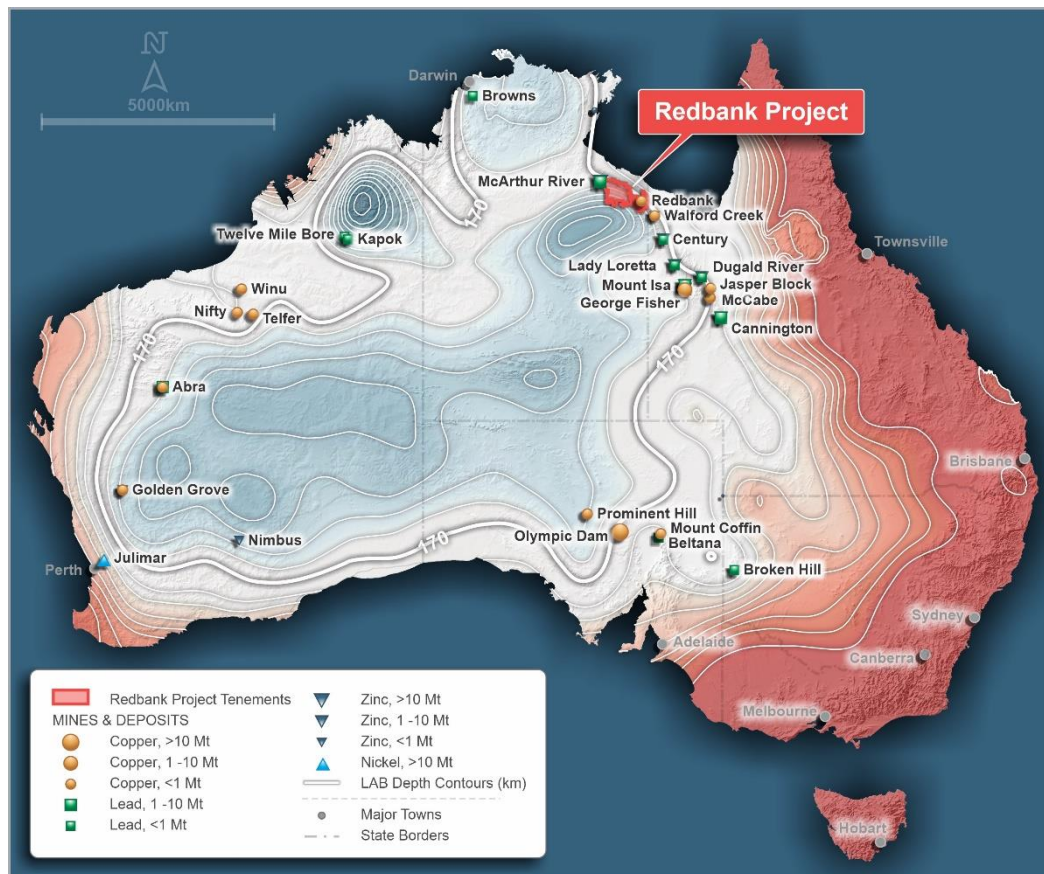

Figure 2: Map of Australia showing the 170km LAB with known significant deposits (adapted from Hoggard et al, 2020)

GEOPHYSICAL REVIEW - GRAVITY

A review of historical geophysical surveys completed at Redbank has identified characteristic gravity, IP and EM responses associated with known mineralised breccia pipes. These responses are interpreted to be derived from the near surface oxide component which contains high grade copper mineralisation. Of these methods the review concluded high resolution gravity and ground EM were most successful at defining breccia pipes.

Ground-based gravity surveys have been completed in two separate programs, in 2009 on 200m x 100m station spacing with select infill to 100m x 100m station spacing and in 2021 on 200m x 100m station spacing.

A total of 28 gravity targets have been identified within tenement ERL94 with the review recommending ground investigations comprising surface sampling and ground EM be completed to prioritise drill targets.

MANAGEMENT COMMENTARY

NT Minerals Limited commented:

After an extremely difficult period of uncertainty the Company has now stabilised its financial, board and management positions and is able to concentrate on building company and shareholder value based on existing its project package and the ability to seriously entertain other opportunities within the region and greater Northern Territory.

-ENDS-

Mal James
Chairman
Ph: +61 8 9362 9888

This announcement was approved and authorised for issue by the Board of NT Minerals.

Competent Person's Statement

The information that relates to Exploration Results is based on, and fairly represents, information compiled by Mr Michael Cowin, a Competent Person, who is a Member of the Australian Institute of Geoscientists. Mr Cowin is employed as a Consulting Geoscientist at NT Minerals Limited. Mr Cowin has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration, and to the activity he is undertaking, to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Cowin consents to the inclusion of the matters based on his information in the form and context in which it appears.

Disclaimer

This announcement contains certain forward-looking statements. Forward looking statements include but are not limited to statements concerning NT Minerals Limited's ('NTM's) planned exploration program and other statements that are not historical facts including forecasts, production levels and rates, costs, prices, future performance or potential growth of NTM, industry growth or other trend projections. When used in this announcement, the words such as "could", "plan", "estimate", "expect", "intend", "may", "potential", "should", and similar expressions are forward-looking statements. Such statements are not a guarantee of future performance and involve unknown risks and uncertainties, as well as other factors which are beyond the control of NTM. Actual results and developments may differ materially from those expressed or implied by these forward-looking statements depending on a variety of factors. Nothing in this announcement should be construed as either an offer to sell or a solicitation of an offer to buy or sell securities.

Redbank Project Summary

The Redbank Project located in the southeast McArthur Basin extending from the Northern Territory/Queensland border north-west to Glencore's McArthur Mine, NTM currently holds 9,053km² of granted tenure and 4,132km² of tenement in-application.

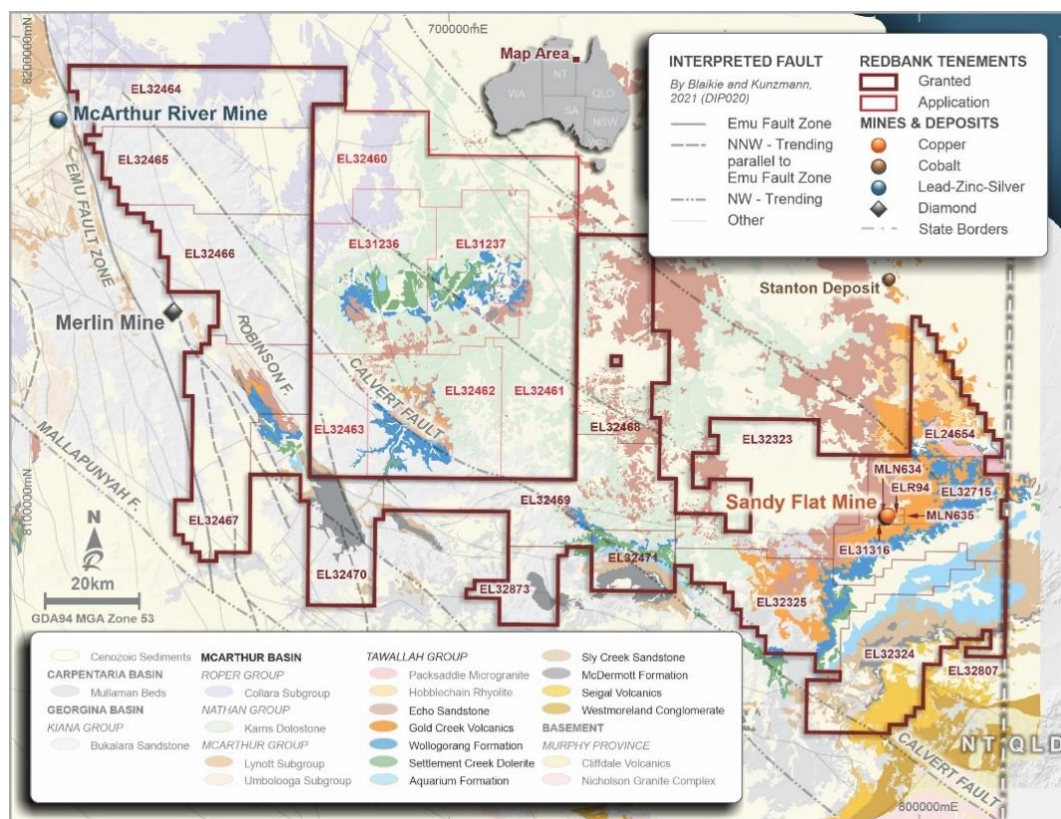

In July 2020, NT Minerals secured this district scale tenement holding, pegging open ground following ground-breaking work by Geoscience Australia. This work highlighted the prospectivity for Tier 1 base metal deposits between the world-class deposits of McArthur River and Century. NT Minerals Limited through its 100% subsidiary Redbank Operations Pty Ltd holds the tenements with a 100% interest.

The Redbank Mining Centre has +100 years of small-scale mining and prospecting centred around copper-mineralised breccia pipes, having a surface or near-surface expression of up to 130m in diameter. Limited historical drilling confirms the mineralised breccia pipes extend to at least 300m depth.

The Redbank Mining Centre contains a JORC2012-compliant Mineral Resource Estimate of **8.4Mt at 1.1% Cu (0.3% Cu cut-off) for 88,600 tonnes of contained copper (Refer ASX:RCP 24 June 2021)** contained in seven individual breccia pipes.

Between 1993-1996 approximately 170,000t @ 4.6% Cu was mined at Sandy Flat in the Redbank Mining Centre to a depth of 50m and treated through a conventional flotation circuit.

Between 2003-2009 stockpiled oxide ore was treated using vat leach to produce a copper cement product (~85% Cu).

JORC Code Table 1

SECTION 1 REVERSE CIRCULATION DRILLING (RC), GROUND GEOPHYSICS AND SOIL SAMPLING

Michael Cowin, a Consulting Geologist to NT Minerals Ltd, compiled the information in Section 1 and Section 2 of the following JORC Table 1 and is the Competent Person for those sections. The following Table and Sections are provided to ensure compliance with the JORC Code (2012 edition) requirements for the reporting of Exploration Results. For further detail, please refer to the announcements made to the ASX by former Redbank Copper Ltd relating to the Redbank Project.

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	<p><u>Reverse Circulation Drilling (RC)</u></p> <p>Information discussed in this announcement concerns exploratory Reverse Circulation (RC) drillholes completed between July- Sept 2022 and 2023.</p> <p>Individual samples are collected from the rig on a 1m basis in each drillhole.</p> <p>Each 1m sample is split using a rig-mounted, conical, dual shoot splitter delivered into a 2-3kg calico bag and the bulk passed into a green plastic RC bag.</p> <p>Samples for first-pass geochemical analysis may be submitted as 4m-composited intervals over the length of each hole at the discretion of the rig site Geologist, who monitors visual indications of mineralisation and may modify the sampling interval to 1m analyses accordingly.</p> <p>To ensure the quality of the RC samples collected, every effort was made to drill all samples dry. Water incursion is noted in the drill logs.</p> <p>Drilling was completed dry using dust suppression but without and water injection.</p>

Criteria	JORC Code explanation	Commentary
		<p>Metre delineation was controlled by means of visual marks on the mast chain on rig. The metre marks were checked for accuracy at the start of the drilling program.</p> <p>The sampling methodology is industry standard and considered both representative and appropriate for both breccia-hosted and stratabound sedimentary-hosted copper mineralisation.</p> <p><u>Gradient Array Induced Polarisation Survey (GAIP)</u></p> <p>1kmx1km square grid surveyed along 100m internal spaced lines with potential electrode pots at 50m spacing. A reading of (i) chargeability and (ii) resistivity is taken between two pots spaced 50m apart along the 100m spaced lines. The sample point for chargeability and resistivity is the mid-point between the potential electrode pots. Therefore, each 1km² of GAIP area surveyed has 200 readings taken at 50m intervals along 100m spaced lines. Readings are recorded using an EMIT SmarTEM24 receiver. Data stored in the SmarTEM24 are downloaded and transferred via secure FTP to Redbank's server at the end of everyday.</p> <p>The current electrodes are placed 500m outside and either side of the 1km² measured array. The current electrodes are therefore spaced at 2km apart.</p> <p>A 2 second square wave current is transmitted to the current electrodes using a Honda EU70i 32A/7kVA GenSet and a GDD Inc model Tx4 transmitter.</p> <p><u>Soil Sampling</u></p> <p>Regional soil sampling has been undertaken with samples initially collected at 500m spacings and selectively infilled to 250m or 100m. The sampling program being reported is an extension of the 2020 soil</p>

Criteria	JORC Code explanation	Commentary
		<p>sampling program reported in an ASX announcement on 29 April 2021.</p> <p>The current soil sampling program commenced on 20 June 2022. Samples obtained from the current 2022 soil sampling campaign were delivered for analysis to Intertek in Townville for sample preparation and then to the Perth laboratory for assaying.</p> <p>All soil sampling are reported as batch results are finalised. A complete set of soil results are not yet available for release as soils programs are ongoing.</p> <p><u>Magnetotelluric (MT) survey</u></p> <p>Zonge Engineering were contracted to record MT soundings at 1 to 2 km station spacing for the southern regional line and 200m station spacing for the northern line. Phoenix MTU receivers and Phoenix broadband MTC150L coils collected the electric and magnetic field components. These receivers collect over 10000-0.001 Hz frequency ranges. Stations were deployed for a minimum of 4 hours and usually overnight. Data was recorded using a MTU-5A. Images of MT inversions are from field data and are preliminary although the final inversion results are not expected to be materially different to the preliminary images presenting in this announcement.</p> <p><u>Airborne EM Survey – VTEM-Max</u></p> <p>UTS Geophysics were contracted to fly 3,512 line kms of a helicopter borne electromagnetic survey. VTEM Max is a time domain EM system. The EM sensor is flown at a nominal 35m above ground surface. Magnetics is also collected from a sensor at a nominal 73m above ground surface. Based on an airspeed of 80-100km/h readings are taken at 2 to 4m along survey lines.</p>

Criteria	JORC Code explanation	Commentary
		<p>This survey uses a base frequency of 25Hz, recording both Z and X coil components, with a peak dipole moment of 700,000 nAl transmitter pulse width of 7ms.</p> <p><u>Ground Gravity Survey</u></p> <p>A Redbank gravity survey was historically completed by Haines Surveys in 2009 (CR2009-0540) inside ERL94. The survey was conducted on 200m x 200m stations with infill to 100m x 100m over selected prospective areas. The RasterTC program was used to calculate the terrain correction in 2021 using an Aerometrix digital surface model (DSM) completed in 2016. This was supplied at a 50cm grid spacing with a relative vertical accuracy of 30cm and providing the best available terrain model. The same DSM data was applied to an extensional ground gravity survey into EL32715 completed by Atlas Geophysics in 2021.</p>
	<p><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></p>	<p><u>GAIP survey</u></p> <p>The chargeability is a dimensionless ratio of mV/V. The resistivity is measured in Ohm.m ($\text{kg.m}^3.\text{s}^{-3}.\text{A}^{-2}$). Due to the varying position of current electrodes from one 1km² array to the next some normalisation or levelling of the data is required to ensure that imaging of the values between arrays provides interpretable imagery.</p> <p><u>Soil Sampling</u></p> <p>Soil samples are collected and logged via a Panasonic ToughBook recording a GPS location, and a photograph of the soil sample location using OCRIS software to record meta-data.</p>

Criteria	JORC Code explanation	Commentary
		<p><u>Magnetotelluric (MT) survey</u></p> <p>The long recording period for passive electric and magnetic field sensors ensures that signal to noise ratio is maximised. Zonge Engineering are industry leaders in MT acquisition and use bespoke sensors and recording equipment to ensure quality MT soundings.</p> <p><u>Airborne EM Survey – VTEM-Max</u></p> <p>Daily HAC (high altitude calibration) data is reviewed to ensure the noise envelope is not compromised by either external EM fields (radio frequency transmitters) and internal system + helicopter noise. Daily survey data is delivered to Geotech in Toronto for QA/QC checks before being accepted. Redbank has retained Core Geophysics Pty Ltd to manage UTS Geophysics in its performance of the VTEM survey.</p>
	<p><i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i></p>	<p>The Induced Polarisation (IP) technique is considered appropriate for detection of disseminated sulphides. Previous IP surveys at the Redbank Project in the mid-1970s has located disseminated chalcopyrite (CuFeS_2). Thin section petrography descriptions highlight the lack of pyrite (FeS_2) associated with mineralisation. Both chalcopyrite and pyrite are polarisable and give chargeability responses. With the lack of pyrite, the reasons for a chargeability anomaly from sulphides is reduced to copper sulphides. In undeformed/unmetamorphosed rock, fine grained magnetite (Fe_3O_4) can also be chargeable.</p> <p>The IP survey is operated by a qualified geophysicist employed by Core Geophysics Pty Ltd. Current electrodes are formed from metal sheets and star pickets placed in 60cm deep electrode pits; receiving potential electrode pots are Tinker & Raser model 3A half-cell electrodes. Electrical wire is Elcon Cable SDI1.5-3.3kV & SDI2.5-3.3kV.</p>

Criteria	JORC Code explanation	Commentary
		<u>Soil Sampling/MT Survey/VTEM Survey</u> – explanation not applicable.
	<i>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i>	Industry standard drilling practices were employed to collect representative downhole samples for analysis.
Drilling techniques	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	RC drilling was conducted using an 8x 8 wheel UDR1000 rig with an onboard 1150CFM/351psi air compressor and a similarly rated external compressor combined with 2000CFM/1000psi booster using 6 m rods (4 ½ inch) and a face sampling percussion hammer (5 to 5 ¾ inch).
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	Recoveries from each metre of drilling were not measured, but visual inspection and monitoring of samples in the field indicate that recoveries were visually consistent, and variations were logged. The drilling string shroud tolerance was monitored to minimise dust, and metre delineation was kept in check by monitoring marks on the chain. No material bias is expected in grade or recovery between the preferential loss/gain of fine/ coarse media.
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged.</i>	All RC chip samples were geologically logged in the field to metre resolution, recording information on rock type, mineralogy, mineralisation, fabrics, textures and alteration. Representative sub-samples were collected and stored in chip trays for future reference. All logging was qualitative for geological data collection and quantitative for geochemical data.

Criteria	JORC Code explanation	Commentary
		Samples were geologically logged to a sufficient level of detail to support a Mineral Resource Estimation.
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	<p>A rig-mounted, conical splitter was used for all drill samples delivered from the rig.</p> <p>Composited-samples for analysis were collected by means of a sampling spear from metre-interval plastic bags.</p> <p>Single metre samples of anomalous composite intercepts are made.</p> <p>At the laboratory, the samples are dried, crushed and pulverised (90% passing 75 microns). A 100g sample was retained from the pulverised sample for a four acid (complete) digest and copper analysis (ppm) by standard ICP-MS. Soil samples are analysed for low level analysis on the Argilent 8800 Quadrupole ICP-MS (ICP-QQQ) in Perth</p> <p>Quality control included inserting CRM samples into the sampling chain at a rate of approximately 1 CRM sample for every 50 original samples. Both blank and duplicate samples were each inserted at a rate of 1 in 50 samples. The total population of control samples for soils and drilling was 6%.</p> <p>None of the 2022 CRM types contain enough data points to carry out a statistically significant analysis. A basic graphical assessment of the CRM assay results did not show significant bias.</p> <p>The laboratory blanks show no issues with contamination. The drilling sample size (2 - 3kg) and the soil sample size (<1kg) is regarded as appropriate for the nature and type of material sampled.</p> <p>No studies have been undertaken to determine whether sample size</p>

Criteria	JORC Code explanation	Commentary
		<p>was appropriate of the material sampled.</p> <p>In 2022, an Olympus Vanta M portable XRF analyser was used to analyse 1m metre-based samples at the rig to monitor copper anomalism at the drill site and assist with sample selection.</p>
Quality of assay data and laboratory tests	<p><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></p> <p><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <p><i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></p>	<p>Samples were assayed to accepted industry standards at nationally certified laboratories. Multi-acid digestion of pulverised sample was followed by appropriate ICP-MS/ OES technique.</p> <p>The 2022 RC drill samples were submitted into Intertek in Townsville for analysis.</p> <p>No check samples were sent to independent laboratories.</p> <p>Induced Polarisation (GAIP/DDIP) Current Electrodes are formed from metal sheets and star pickets placed in 60cm deep electrode pits. As described, the array configuration necessitates current electrodes 2km apart. Electrical wireconnecting these current electrodes to the genset/transmitter is Elcon Cable SDI1.5-3.3kV & SDI2.5-3.3kV.</p> <p>A 2 second square wave current is transmitted to the current electrodes using a Honda EU70i 32A/7kVA GenSet and a GDD Inc. model Tx4 transmitter.</p> <p>Potential electrode pots are Tinker&Raser model 3A half-cell electrodes. Readings from the pots are recorded using an EMIT SmarTEM24 receiver. Data stored in the SmarTEM24 are downloaded and transferred via secure FTP to Redbank's server at the end of everyday.</p> <p>The IP survey is operated by a qualified geophysicist employed by CoreGeophysics Pty Ltd.</p>

Criteria	JORC Code explanation	Commentary
		Soil Sampling/ MT Survey/VTEM Survey – explanation not applicable
Verification of sampling and assaying	<p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p> <p><i>The use of twinned holes.</i></p> <p><i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></p> <p><i>Discuss any adjustment to assay data.</i></p>	<p><u>GAIP Survey</u></p> <p>Tests to determine the most appropriate potential electrode pot spacing were undertaken. Chargeability and resistivity readings were taken with pot spacings of 50m, 100m and 200m. The readings over the same area were independent of the pot spacing and for the first two GAIP arrays reported in this announcement, a high spatial density of potential electrode pot readings was considered appropriate to validate IP survey results from mid-1970s surveys and also provide an appropriate signature of chargeability and resistivity over the known disseminated copper sulphide (chalcopyrite) mineralisation forming the Bluff deposit.</p> <p><u>Soil Sampling</u></p> <p>The 500m x 500m sample spacing is considered appropriate for regional soil sampling. Any anomalous soil samples with elevated base metal values or lanthanides (REEs) will have infill soil samples collected at a closer sample spacing to enable any discrete soil anomaly to be resolved across a number of soil samples.</p> <p>Twin drillholes were not used for independent verification</p>
Location of data points	<p><i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></p> <p><i>Specification of the grid system used.</i></p>	<p>2022 RC collars were positioned by means of a handheld Garmin GPSMAP 64ST GPS using GDA 94 Zone 53 and transformed to GDA2020 Zone 53.</p> <p>Accuracy of modern handheld GPS is regarded as appropriate for reconnaissance drill holes.</p> <p>Down-hole survey data was collected on all angled and vertical</p>

Criteria	JORC Code explanation	Commentary
	<i>Quality and adequacy of topographic control.</i>	<p>drillholes at the time of drilling using a gyro.</p> <p>All drilling data points were transformed to GDA2020 Zone 53.</p> <p>Hand-held GPS was used to locate the current electrodes and outside area of the 1km² array. Pot spacing along 100m lines were located using a 50m length measuring tape and wire (exactly 50m in length).</p> <p>All electrode and potential pot locations are located using the MGA2020 coordinate system and are in GDA2020 Zone 53 coordinates.</p> <p>For soil sampling, the position is collected from a handheld GPS. Cross-checks against 50cm resolution satellite imagery and 15cm resolution airborne photogrammetry provides a good match. Samples are considered accurate to within 1 metre.</p>
Data spacing and distribution	<p><i>Data spacing for reporting of Exploration Results.</i></p> <p><i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></p> <p><i>Whether sample compositing has been applied.</i></p>	<p>Reconnaissance drilling was completed on irregular line and hole spacing. Documented sample compositing may be applied.</p> <p>GAIP potential electrode pots spacing 50m x 100m.</p> <p>MT stations are spaced at 1 to 2km intervals for the southern line and 200m spacing for the shorter northern line.</p> <p>AEM – VTEM Max flight lines are spaced 100m in the central portion and 150m line spacing on the western and eastern ends of the survey area. All lines are flown north-south.</p> <p>Gravity stations were close-spaced to reflect the small breccia pipe target size.</p> <p>2022/ 23 soil samples are spaced at a 500m x 500m grid spacing to</p>

Criteria	JORC Code explanation	Commentary
Orientation of data in relation to geological structure	<p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></p> <p><i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></p>	<p>understand regional alteration patterns and closed-down to create more coherent anomalies.</p> <p><u>Reverse Circulation Drilling:</u></p> <p>It is assumed that the orientation of sampling has achieved unbiased sampling of structures or mineralisation, with reconnaissance drill holes targeting horizontal targets. Additional work will outline the nature of the target horizons in more detail.</p> <p>The relationship between the drilling orientation, and the orientation of key mineralised structures is not considered to have introduced any material sampling bias.</p> <p><u>GAIP survey:</u></p> <p>Where practical current electrodes are oriented perpendicular to the general strike of the geology to inhibit current channelling and ensure the current flux pathway from 2km spaced current electrodes completes the circuit over as large a volume of rock as possible between the current electrodes. Testing of potential electrode pots spacing where chargeability and resistivity are generally independent of this spacing provides some confidence that a good distribution of current flux pathways has been achieved.</p>
Sample security	<p><i>The measures taken to ensure sample security.</i></p>	<p>RC samples were dispatched to the laboratory as soon as possible after collection. Chain of custody is assumed to have been maintained throughout the sampling and dispatch process, although not been strictly documented.</p> <p>Data is transferred from the SmarTEM24 receiver at the Redbank Project to the Company's server via MS Sharepoint.</p>

Criteria	JORC Code explanation	Commentary
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	<p>Drilling data is reviewed before loading to the database.</p> <p>All data is reviewed by the Principal Geophysicist of Core Geophysics Pty Ltd prior to further processing, imaging and interpretation.</p>

SECTION 2: 7 BRECCIA PIPE DEPOSITS GLOBAL ESTIMATION AND REPORTING OF MINERAL RESOURCES COMPILED BY REDBANK COPPER LTD

(Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary																																																												
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	<p>NTM owns 100% of the Redbank Project in the Northern Territory via its wholly owned subsidiary Redbank Operations Pty Ltd. The Redbank Project comprises the tenements in the Table below.</p> <p>Table: Redbank Tenement Summary</p> <table><tr><th colspan="5">Redbank Operations Pty Ltd Tenements</th></tr><tr><th>No.</th><th>EL_ML</th><th>Area km²</th><th>Grant date</th><th>Expiry date</th></tr><tr><td>1</td><td>MLN634</td><td>0.1618</td><td>12-Mar-73</td><td>31-Dec-28</td></tr><tr><td>2</td><td>MLN635</td><td>0.1618</td><td>12-Mar-73</td><td>31-Dec-28</td></tr><tr><td>3</td><td>ERL94</td><td>19.05</td><td>10-Aug-89</td><td>9-Aug-24</td></tr><tr><td>4</td><td>EL31316</td><td>0.97</td><td>6-Feb-17</td><td>5-Feb-23</td></tr><tr><td>5</td><td>EL32715</td><td>715.79</td><td>18-Jun-21</td><td>17-Jun-23</td></tr><tr><td>6</td><td>EL24654</td><td>328.5</td><td>5-Dec-05</td><td>4-Dec-22</td></tr><tr><td>7</td><td>EL32323</td><td>820.51</td><td>10-Sep-20</td><td>9-Sep-26</td></tr><tr><td>8</td><td>EL32324</td><td>811.41</td><td>10-Sep-20</td><td>9-Sep-26</td></tr><tr><td>9</td><td>EL32325</td><td>704.85</td><td>10-Sep-20</td><td>9-Sep-26</td></tr><tr><td>10</td><td>EL31236</td><td>816.98</td><td>In Application</td><td></td></tr></table>	Redbank Operations Pty Ltd Tenements					No.	EL_ML	Area km²	Grant date	Expiry date	1	MLN634	0.1618	12-Mar-73	31-Dec-28	2	MLN635	0.1618	12-Mar-73	31-Dec-28	3	ERL94	19.05	10-Aug-89	9-Aug-24	4	EL31316	0.97	6-Feb-17	5-Feb-23	5	EL32715	715.79	18-Jun-21	17-Jun-23	6	EL24654	328.5	5-Dec-05	4-Dec-22	7	EL32323	820.51	10-Sep-20	9-Sep-26	8	EL32324	811.41	10-Sep-20	9-Sep-26	9	EL32325	704.85	10-Sep-20	9-Sep-26	10	EL31236	816.98	In Application

	The Redbank Project was purchased from Redbank Copper Pty Ltd, by						

Criteria	JORC Code explanation	Commentary
		<p>Redbank Mines Pty Ltd in 2005 (see ASX announcement 31st Aug 2005). Redbank Mines Pty Ltd then changed its name to Redbank Copper Limited in 2009.</p> <p>The 2005 Sale Agreement dated 5 August 2005 verifies the transaction.</p> <p>All tenements are in good standing.</p> <p>On 10 June 2022 Redbank Copper Ltd changed its name to NT Minerals Ltd (ASX:NTM).</p> <p>Native title has not been granted on all the granted tenements.</p> <p>The Sandy Flat Mine Site/ processing facility is believed to be the source of pollution which affects the surrounding environment. The Northern Territory of Australia acknowledges that no action by Redbank has contributed to the pollution. To facilitate the Northern Territory of Australia access to the Site to carry out works to enable improved environmental outcomes for the mining site and its surrounds, Redbank entered into an agreement with the Northern Territory of Australia on the 29 June 2016, to surrender the mining leases. The mining leases were replaced by EL31316 granted on the 6 February 2017.</p>
Exploration done by other parties	<i>Acknowledgment and appraisal of exploration by other parties.</i>	<p>Copper mineralisation was first discovered at Redbank in 1916. The Redbank area has been subject to an almost continuous history of discovery and mining.</p> <p>The Redbank area has been systematically explored by numerous companies since 1969. Prominent amongst these were Newmont NEWAIM JV (1971-1972), Triako Mines NL (1972-1983) with various JV partners (Amax Iron, Aquitane Australia Minerals) and Alameda with CRA Exploration.</p> <p>Previous work included, geologic mapping, soil geochemistry, airborne and ground geophysics, extensive drilling campaigns and early non-</p>

		JORC resource calculations (1970s to 1980s) and rudimentary 2004 JORC calculations (1989-2004). SRK Consulting completed MREs (JORC 2004) between 2005-2011. A JORC2012 MRE was reported on 24 June 2021.
Geology	<i>Deposit type, geological setting, and style of mineralisation.</i>	<p>The known Redbank mineralisation is consistent with breccia pipe deposits.</p> <p>The Redbank mineralisation consists of at least 7 discrete mineralised pipe-shaped deposits, although more than 50 pipe-like intrusions have been identified in the district.</p> <p>Copper bearing breccia pipes of the Redbank district intrude an interbedded sequence of Paleoproterozoic-aged igneous and dolomitic sedimentary rocks which have undergone regional scale potassic alteration or metasomatism.</p> <p>Breccia pipes are steeply inclined and near cylindrical.</p> <p>The core of these pipes contains both autochthonous and allochthonous breccias, with copper mineralisation confined to the breccia matrix.</p>
Drill hole Information	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i></p> <ul style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <p><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the</i></p>	N/A.

Criteria	JORC Code explanation	Commentary
	<i>report, the Competent Person should clearly explain why this is the case.</i>	
Data aggregation methods	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p> <p><i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p> <p><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></p>	N/A.
Relationship between mineralisation widths and intercept lengths	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></p> <p><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i></p>	N/A.
Diagrams	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	Numerous diagrams are presented to provide as much context as possible to the location of the work completed to known deposits.
Balanced reporting	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results.</i>	N/A.
Other substantive exploration data	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock</i>	Since the discovery of copper at Redbank, considerable geological information concerning the mineralisation and its host has been compiled. Similarly, numerous geochemical soil surveys and geophysical surveys have been conducted across the tenement

Criteria	JORC Code explanation	Commentary
	<i>characteristics; potential deleterious or contaminating substances.</i>	<p>package. This information is well documented in company annual reports.</p> <p>Historical metallurgical test work on drill core samples from the Redbank Project was carried out principally in the 1970s and 1980s prior to AMALG constructing the plant from 1993 to 1995. More recently metallurgical testing was conducted by AMMTEC from 2006-10, with samples from the various deposits tested for various leach and comminution tests.</p> <p>Additional geotechnical data was added post 2005. SRK was contracted in late 2008 to provide geotechnical studies on the available core and outcrop, to refine slope angles in optimisation work being undertaken on block models generated from the resource. Geotechnical samples were submitted to SGS Rock Mechanics Laboratory in Welshpool in 2009.</p> <p>In 2020 samples of mineralised breccia pipe were selected for physical property measurements, and in particular, chargeability determinations. The average of these chargeability determinations was 16.2 mV/V with the highest value of 80 mV/V. The copper mineralised breccia deposit provide a good chargeability response compared to background chargeability of non-mineralised samples of ~4mV/V</p>
Further work	<p><i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p> <p><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></p>	<p>Ground IP surveying is complete generating chargeability targets</p> <p>VTEM survey is complete.</p> <p>Soil sampling is ongoing.</p> <p>MT surveying is complete.</p> <p>Ground gravity was not complete and remains ongoing in 2023.</p>

Criteria	JORC Code explanation	Commentary
		Appropriate diagrams showing drillholes, soil locations, GAIP/ IP, MT sectional images, VTEM inversion images have been used

COMPETENT PERSON'S STATEMENT

The information that relates to Exploration Results is based on, and fairly represents, information compiled by Mr Michael Cowin, a Competent Person, who is a Member of the Australian Institute of Geoscientists. Mr Cowin is employed as a Consulting Geologist by the Company. Mr Cowin has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration, and to the activity he is undertaking, to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Cowin consents to the inclusion of the matters based on his information in the form and context in which it appears.
