## BROAD COPPER MINERALISED ZONE INTERSECTED AT YANNERY

---

### Highlights:

- **Copper mineralisation** intersected in all 15 RC holes drilled at Yannery prospect confirmed by pXRF analysis, 800m northeast of Whundo\*
- Mineralised zone up to **100m wide** plunges to the north at 35 - 40 deg and remains open at depth
- The down dip portion of the mineralised zone remains largely untested
- Past drilling and historic mining highlights potential for high grade copper lodes within a broad mineralised envelope
- Historical production included **1,132 tonnes @ 21% Cu ore**
- Yannery is a typical Whundo cluster copper dominant VMS deposit
- Yannery adds potential for further expansion of the current Whundo project mineral resource of 3.6mt @ 1.2% Cu and 1.4% Zn
- A total 541 samples have been dispatched for laboratory analysis

GreenTech Metals Ltd (ASX: GRE), ('**GreenTech**' or 'the **Company**') is pleased to announce the drilling program at the Yannery prospect, part of the Company's Whundo Copper Project in Western Australia's Pilbara region, has concluded with the historically mined higher grade near surface mineralised horizon identified. The drilling has also provided preliminary evidence of a second mineralised zone potentially extending to depth.

Executive Director Thomas Reddicliffe commented: "Our recent maiden exploratory drill program at Yannery has not only confirmed significant copper mineralisation but has also provided important geospatial information relating to the nature and extent of the mineralisation. What we do know at this early stage is that Yannery is shaping up as another discrete Whundo cluster VMS deposit so we anticipate that the high-grade lodes reported both historically and more recently by Fox Resources will likely occur elsewhere within the larger mineralising event. Also, as at Whundo, we are seeing early evidence in the drilling of a second mineralised zone below that which was selectively mined. We are now looking forward to receiving the assay results to then be able to determine the next drill program required to unlock further potential at this prospect."

\* Refer cautionary statement

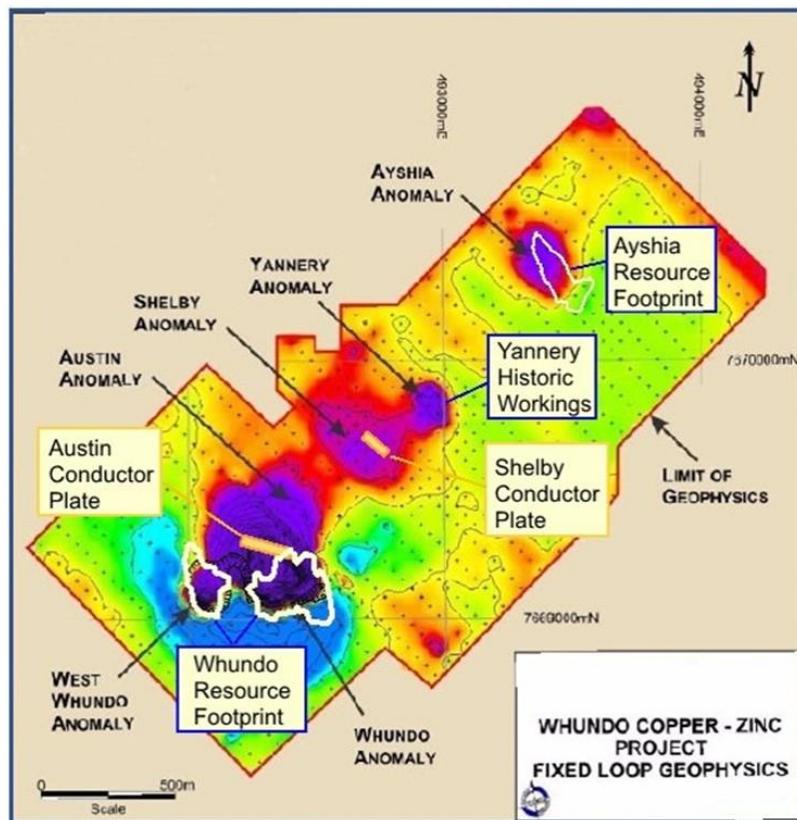

Figure 1: Whundo project

### Mining History

The Yannery prospect, located only ~800m from the main Whundo pits and 700m from Ayshia, was mined historically over two periods from 1920-1958 and 1952-1968. There are records of intermittent production in the period 1920-1958 of 1132 tonnes of copper ore **averaging 21% Cu**, and in the period 1952-1968 a further 1911.8 tonnes of cupreous ore **averaging 12.87% Cu** was reported to have been mined from the oxidised and supergene zone<sup>1</sup>. Underground workings comprising an adit and numerous shafts are present which are limited to the near surface oxidised portion of the prospect.

<sup>1</sup>Yannery Hill Copper mine, Karratha, City of Karratha, Western Australia, Australia (mindat.org)

**Figure 2:** Yannery copper mine tip, circa 1972

### Past Exploration Activity

Exploration by Fox Resources Ltd in 2006 identified a mineralised zone within the Yannery prospect but peripheral to the historically mined area. This previous work by Fox included RC drilling for a total of nine holes and a fixed loop electro-magnetic (FLEM) survey. The Fox drill sample assay results included:

- Hole YNRC004 - 10m @ 2.05% Cu from 40m, including 3m @ 6.10% Cu
- Hole YNRC005 – 1m @ 3.16% Cu from 43m
- Hole YNRC007 – 10m @ 3.5% Cu from 39m, including 4m @ 8.3% from 41m<sup>2</sup>

### Current Exploration

Greentech has expanded upon the previous drilling by Fox in 2006 aimed at determining the extent and tenor of the copper lodes that were historically selectively mined.

A 729m drilling program comprising 15 RC holes was conducted, many of which were shallow due to intersecting underground workings of which the locations were not accurately known. Details of the drilling are shown in Table 1.

<sup>2</sup>ASX Announcement Fox Resources Ltd, Down Hole & Surface Electromagnetic Surveys in Progress at Yannery 14 November 2012

### Preliminary Drilling Results and Sampling

Initial visual results confirmed by the use of an Olympus Vanta pXRF analyser revealed a shallow copper mineralised horizon spatially consistent with the underground workings and mineralisation previously identified by drilling undertaken by Fox. This horizon plunges to the north at 35 -40 degrees and based on interpretation of drill intersections has a near surface width of some 100m.

The recent Greentech drilling also suggests evidence of a second copper mineralised zone at depth separate to and beneath the mineralised zone associated with the historic near surface workings. The extent and tenor of this deeper mineralisation is not clear from the drilling at this stage. To investigate this deeper mineralisation and the deeper extensions of the main mineralised horizon which currently remains largely untested, three of the deeper drill holes have been prepared for DHEM survey which will be completed in the coming days. These DHEM surveys are aimed at identifying additional targets that will potentially warrant follow-up drill testing.

A total of 541 drill samples have been dispatched to ALS Global Laboratories in Perth for analysis. Results will be reported following receipt and assessment of the results.

## Bertram Prospect

The Company recently acquired the Bertram project, located just south of Whundo, covering approximately 16km<sup>2</sup>. Fox Resources conducted exploration over the project area in 2008 and 2009 after concluding that there was potential for massive sulphide mineralisation within thin ultramafic horizons identified by their strong magnetic signature.

**Figure 6:** Bertram project

Fox undertook a VTEM survey over the Bertram area and identified four conductors proximal to previous historic drilling which intersected 1.8m at 3.4% Cu from 22m. Initial drilling of these targets intersected shallow, fresh massive and stringer nickel and copper sulphides. Greentech plans to undertake follow-up exploratory work on these targets.

This announcement is approved for release by the Board of Directors

## About GreenTech Metals Limited

The Company is an exploration and development company primarily established to discover, develop, and acquire Australian and overseas projects containing minerals and metals that are used in the battery storage and electric vehicle sectors. The Company's founding projects are focused on the underexplored nickel, copper and cobalt in the West Pilbara and Fraser Range Provinces.

The green energy transition that is currently underway will require a substantial increase in the supply of these minerals and metals for the electrification of the global vehicle fleet and for the massive investment in the electrical grid, renewable energy infrastructure and storage.

## Competent Person Statement

Thomas Reddicliffe, BSc (Hons), MSc, a Director and Shareholder of the Company, is a Fellow of the AUSIMM, and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Thomas Reddicliffe consents to the inclusion in the report of the information in the form and context in which it appears.

## \*Cautionary Statement

The Company notes that while the oxide mineral species malachite is readily observable in RC drill chips when present, the relative abundance of is particularly subjective due to the manner in which the logged chips are selected as only the chips are observed rather than the powdered fines. In this respect while the estimated percentage of malachite in mineralised intervals can be quite variable it never exceeded 15% and was more usually estimated at 1% – 2%. In relation to the disclosure of visual mineralisation, the Company cautions that visual estimates of oxide abundance should never be considered a proxy or substitute for laboratory analysis. Laboratory assay results are required to determine the widths and grade of mineralisation. The Company will update the market when laboratory analytical results become available for these samples.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <li><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li><i>Include reference to measures taken to ensure sample representiveness and the appropriate calibration of any measurement tools or systems used.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li><i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<ul style="list-style-type: none"> <li>Reverse Circulation (RC) drilling was carried out on the Yannery Project by Fox Resources(2006) and GreenTech Metals (2023).</li> <li>This RC drilling was designed to obtain drill chip samples at one metre intervals, from which a 2-4 kilogram sub-sample was collected for laboratory multi-element analysis including: Ag,Al,As,Ba,Be,Bi,Ca,Cd,Co,Cr,Cu,Fe,Ga,K,La,Mg,Mn,Mo,Na,Ni,P,Pb,S,Sb,S c,SrTh,Ti,Tl,U,V,W,Zn.</li> <li>Samples from each metre were collected through a rig-mounted cyclone and split using a rig-mounted static cone splitter.</li> <li>Field duplicates were taken as well as blanks and Certified Reference Samples inserted at regular intervals and submitted for analysis to monitor QAQC.</li> <li></li> </ul>
Drilling techniques	<ul style="list-style-type: none"> <li><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<ul style="list-style-type: none"> <li>An RC drill rig was used by both Fox Resources and GreenTech Metals to undertake the drill programs.</li> </ul>
Drill sample recovery	<ul style="list-style-type: none"> <li><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<ul style="list-style-type: none"> <li>Sample recoveries are recorded by the geologist in the field during logging and sampling.</li> <li>If poor sample recovery is encountered during drilling, the supervising geologist and driller endeavour to rectify the problem to ensure maximum sample recovery.</li> <li>Visual assessments are made for recovery, moisture, and possible contamination.</li> <li>A cyclone and static cone splitter were used to ensure representative sampling, and were routinely inspected and cleaned.</li> <li>Sample recoveries during drilling were recorded as being high.</li> <li>Since the sample recoveries were good there is no geological reason known that would result in biased grades as a result of poor sample recovery.</li> </ul>
Logging	<ul style="list-style-type: none"> <li><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li><i>Whether logging is qualitative or quantitative in nature. Core (or costean,</i></li> </ul>	<ul style="list-style-type: none"> <li>All drill chip samples are geologically logged from surface to the bottom of each drill hole. It is considered that geological logging is completed at an adequate level to allow appropriate future Mineral Resource estimation.</li> <li>Geological logging of the RC chips is considered quantitative</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <li>channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>All the RC drill holes have been logged in full.</li> </ul>
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>The RC drilling rig was equipped with a rig-mounted cyclone and static cone splitter, which provided one bulk sample of approximately 20-30 kg, and a representative sub-sample of approximately 2-4 kg for every metre drilled.</li> <li>The sample size of 2-4 kg for both types of samples is considered to be appropriate and representative of the grain size and mineralisation style of the deposit.</li> <li>The RC drilling samples were kept dry.</li> <li>Duplicate samples were collected and submitted for analysis. Reference standards were inserted during drilling.</li> </ul>
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>ALS Global (Perth) were used for all analysis of drill samples submitted by both Fox and GreenTech. The laboratory techniques below are for all samples submitted to ALS and are considered appropriate for the style of mineralisation defined within the Yannery Project area: <ul style="list-style-type: none"> <li>Samples above 3 Kg riffle split.</li> <li>Pulverise to 95% passing 75 microns</li> <li>50-gram Fire Assay (Au-AA26) with ICP finish - Au.</li> <li>4 Acid Digest ICP-AES Finish (ME-ICP61) – Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Ti, U, V, W, Zn.</li> <li>Ore Grade 4 Acid Digest ICP-AES Finish (ME-OG62)</li> </ul> </li> <li>Standards were used for external laboratory checks.</li> <li>Duplicates were used for external laboratory checks.</li> <li>No assay results have been received for the samples submitted by GreenTech pertaining to the 2023 drill program.</li> </ul>
<i>Location of data points</i>	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>Many of the significant results were compared with the lithological logging.</li> <li>None of the holes have been twinned to verify grades.</li> <li>All geological logging and sampling information is completed firstly on to paper logs before being transferred to Microsoft Excel spreadsheets. Physical logs and sampling data are returned to the head office for scanning and storage.</li> <li>No adjustments to the assay data were considered necessary.</li> </ul>
	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> </ul>	<ul style="list-style-type: none"> <li>A hand-held GPS was used to locate drill hole collars prior to drilling.</li> <li>After drilling Fox reported that all holes surveyed with DGPS. Drill holes from the GreenTech drill program have not been surveyed.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>• Specification of the grid system used.</li> <li>• Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>• Downhole surveys for the 2006 drill holes were captured at approximately 30 m intervals using a multishot survey camera with potential problems in zones containing magnetic minerals such as magnetite and pyrrhotite.</li> <li>• The grid system used for all GreenTech drilling is GDA94 (MGA 94 Zone 50)</li> <li>• Topographic control is obtained from surface profiles created by drillhole collar data and regional DTMs downloaded from Geoscience Australia Elvis website.</li> </ul>
Data spacing and distribution	<ul style="list-style-type: none"> <li>• Data spacing for reporting of Exploration Results.</li> <li>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>• Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>• Current drillhole spacing is variable and mainly dependent on access requirements for each drill hole. There is usually a fan of several holes with different dips and azimuths drilled from a single drill pad.</li> <li>• Sample compositing has been used for drilling completed by both FOX and GreenTech. All results from the RC drilling is reported at 1 metre downhole sample intervals.</li> </ul>
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <li>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>• If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>• Drill holes were mainly located in order to intersect the target at an angle perpendicular to strike direction however many of the drill holes intersect the mineralisation obliquely. As the target structures were considered to be moderately dipping and moderately plunging, most drill holes were angled at -60 degrees from horizontal.</li> <li>• The orientation of the drill holes has not biased the intercept grades except that the intercept widths are often significantly longer than the true width of the mineralisation.</li> </ul>
Sample security	<ul style="list-style-type: none"> <li>• The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>• The chain of custody is managed by the supervising geologist who places calico sample bags in polyweave sacks. Up to 5 calico sample bags are placed in each sack. Sacks from individual holes were placed into bulk bags, each bulk bag is clearly labelled with the address of laboratory and Sample ID range</li> <li>• Samples were delivered by Fox personnel to the transport company in Karratha on pallets.</li> <li>• The transport company then delivered the samples directly to the laboratory.</li> </ul>
Audits or reviews	<ul style="list-style-type: none"> <li>• The results of any audits or reviews of sampling techniques and data.</li> </ul>	<ul style="list-style-type: none"> <li>• Data was validated by Fox upon up-loading into the master database. Any validation issues identified are investigated prior to reporting of results.</li> </ul>

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and	<ul style="list-style-type: none"> <li>• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites,</li> </ul>	<ul style="list-style-type: none"> <li>• RC drilling by Fox was carried out on M47/009 – now 100% owned by Green Tech Resources Ltd. This tenement forms a part of a broader tenement package that comprises the West Pilbara Project.</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>land tenure status</i>	<p>wilderness or national park and environmental settings.</p> <ul style="list-style-type: none"> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>This tenement is in good standing and no known impediments exist (see map provided in this report for location).</li> </ul>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>The most significant work to have been completed historically in the Whundo area, was by Westfield Minerals NL, later Whim Creek Consolidated NL.</li> <li>Work completed by Westfield/Whim Creek consisted of geological mapping, geophysical surveying, geochemical sampling and diamond and RAB drilling and sampling.</li> <li>This outlined several high-grade shoots including the one mined in the Whundo pit in 1976. An estimated 6,746t of 27.4% Cu ore was produced from the Whundo pit.</li> <li>Whim Creek continued involvement with the project area after becoming Dominion Metals until 1995 when the tenements were sold to Straits Resources Ltd.</li> <li>Dominion had completed drilling and resource estimation on Whundo and pit plans were completed but not implemented.</li> <li>Straits completed drilling along strike to expand resources and did not identify sufficient additional oxide resources to warrant development and shipping to Whim Creek.</li> <li>Fox Resources Ltd obtained control of the tenements from Straits in 2003 and subsequently undertook an extensive drilling program on the West Whundo deposit outlining a combined Oxide/Supergene/Primary Mineral Resource.</li> <li>Most of the original Oxide resource at Whundo and West Whundo was mined by Fox between 2005-2006 in two open pits.</li> <li>Yannery is reported as being mined historically in the periods 1920 -1958 and 1951 – 1958 with a total 3044 tonnes mined by underground mining.</li> </ul>
<i>Geology</i>	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>The Yannery deposit lies on the edge of a window of metamorphosed sedimentary rocks within the Whundo Group (Asv) emerging from below the younger overlying Hardey Formation (AFh) - poorly to moderately sorted, medium- to coarse-grained sandstone, conglomerate, siltstone, shale, and tuff.</li> <li>The mineralisation at Yannery is logged in historical Fox Resources drilling as being massive sulphide lodes with selvages of disseminated sulphides associated with stockworks of veinlet "feeder zones". The main sulphide minerals within the unweathered mineralised lodes are pyrite, pyrrhotite, and chalcopyrite. Quartz and calcite veins and veinlets are common.</li> <li>The mineralisation in the oxide zone from shallow drilling undertaken by GreenTech was malachite, with native copper observed in some holes.</li> </ul>
<i>Drill hole Information</i>	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for</li> </ul>	<ul style="list-style-type: none"> <li>Collar information for all drill holes reported is provided as an appendix to the body of this report.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<p><i>all Material drill holes:</i></p> <ul style="list-style-type: none"> <li>○ <i>easting and northing of the drill hole collar</i></li> <li>○ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i></li> <li>○ <i>dip and azimuth of the hole</i></li> <li>○ <i>down hole length and interception depth</i></li> <li>○ <i>hole length.</i></li> </ul> <ul style="list-style-type: none"> <li>● <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></li> </ul>	
Data aggregation methods	<ul style="list-style-type: none"> <li>● <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i></li> <li>● <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></li> <li>● <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></li> </ul>	<ul style="list-style-type: none"> <li>● All RC sample intervals reported are composed of 1 metre or 3m down hole intervals and are therefore length weighted.</li> <li>● No upper or lower cut-off grades have been used in reporting results.</li> </ul>
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> <li>● <i>These relationships are particularly important in the reporting of Exploration Results.</i></li> <li>● <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></li> <li>● <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i></li> </ul>	<ul style="list-style-type: none"> <li>● True widths of mineralisation have not been calculated for this report, and as such all intersections reported are down-hole thicknesses and compensated for in 3D for the resource modelling.</li> <li>● Due to the moderately to steeply dipping nature of the mineralised zones, it is expected that true thicknesses will be less than the reported down-hole thicknesses.</li> </ul>
Diagrams	<ul style="list-style-type: none"> <li>● Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>● Appropriate maps and sections are available in the body of this report.</li> </ul>
Balanced reporting	<ul style="list-style-type: none"> <li>● Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>● Reporting of results in this report is considered balanced.</li> </ul>
Other substantive exploration data	<ul style="list-style-type: none"> <li>● Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density; groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>● There is no other relevant data to report on.</li> </ul>
