

MOUNT HOPE DELIVERS

138m @ 2.1% Cu, 0.3g/t Au

INCLUDING 39m @ 3.6% Cu, 0.5g/t Au

Carnaby Resources Limited (ASX: CNB) (**Carnaby** or the **Company**) is pleased to announce exceptional new assay results and pXRF readings at the Greater Duchess Copper Gold Project in Mt Isa, Queensland.

Highlights

Mount Hope Central Prospect:

- **MHDD103 Assays:**
 - **Boomerang 138m (TW~41m) @ 2.1% Cu, 0.3g/t Au Including 39m (TW~12m) @ 3.6% Cu, 0.5g/t Au**
 - **And Chalcus 28m (TW~8m) @ 1.2% Cu, 0.3g/t Au**
- **MHDD110 Assays:**
 - **Binna Burra 41m (TW~17m) @ 2.0% Cu, 0.2g/t Au**
 - **Boomerang 48m (TW~15m) @ 2.1% Cu, 0.2g/t Au**
 - **Chalcus 31m (TW~11m) @ 1.8% Cu, 0.4g/t Au**
- **MHRC084 Assays:**
 - **Boomerang 46m (TW~15m) @ 2.2% Cu, 0.2g/t Au Including 35m (TW~11m) @ 2.9% Cu, 0.2g/t Au**
- **MHDD147 pXRF readings:**
 - **Boomerang 100m (TW~34m) @ 2.6% Cu**
 - **Including 68m (TW~23m) @ 3.6% Cu**
- **MHDD133W3 pXRF readings:**
 - **Chalcus 137m (TW~37m) @ 1.5% Cu**
 - **Including 53m (TW~14m) @ 2.8% Cu**
- **MHDD133W2 pXRF readings:**
 - **Chalcus 71m (TW~21m) @ 1.3% Cu Including 49m (TW~14m) @ 1.7% Cu**

The Company's Managing Director, Rob Watkins commented:

"Mount Hope continues to deliver as we drill around the clock with three drill rigs to extend the high grade copper gold discovery at Mount Hope Central and Mount Hope North. Exceptional broad and high grade assay and pXRF intersections from the Boomerang and Chalcus Lodes clearly demonstrate strong continuity and remain completely open along strike and at depth. Mount Hope is rapidly evolving into a major high grade copper gold discovery favourably located in Australia's premier copper mining district."

Company Highlights

- Proven and highly credentialed management team.
- Tight capital structure and strong cash position.
- Mount Hope, Nil Desperandum and Lady Fanny Iron Oxide Copper Gold discoveries within the Greater Duchess Copper Gold Project, Mt Isa inlier, Queensland.
- Greater Duchess Copper Gold Project, numerous camp scale IOCG deposits over 1,022 km² of tenure.
- Projects near to De Grey's Hemi gold discovery on 442 km² of highly prospective tenure.
- 100% ownership of the Tick Hill Gold Project (granted ML's) in Qld, historically one of Australia highest grade and most profitable gold mines producing 511 koz at 22 g/t gold.

GREATER DUCHESS COPPER GOLD PROJECT

MOUNT HOPE CENTRAL PROSPECT (CNB 100%)

CHALCUS LODGE

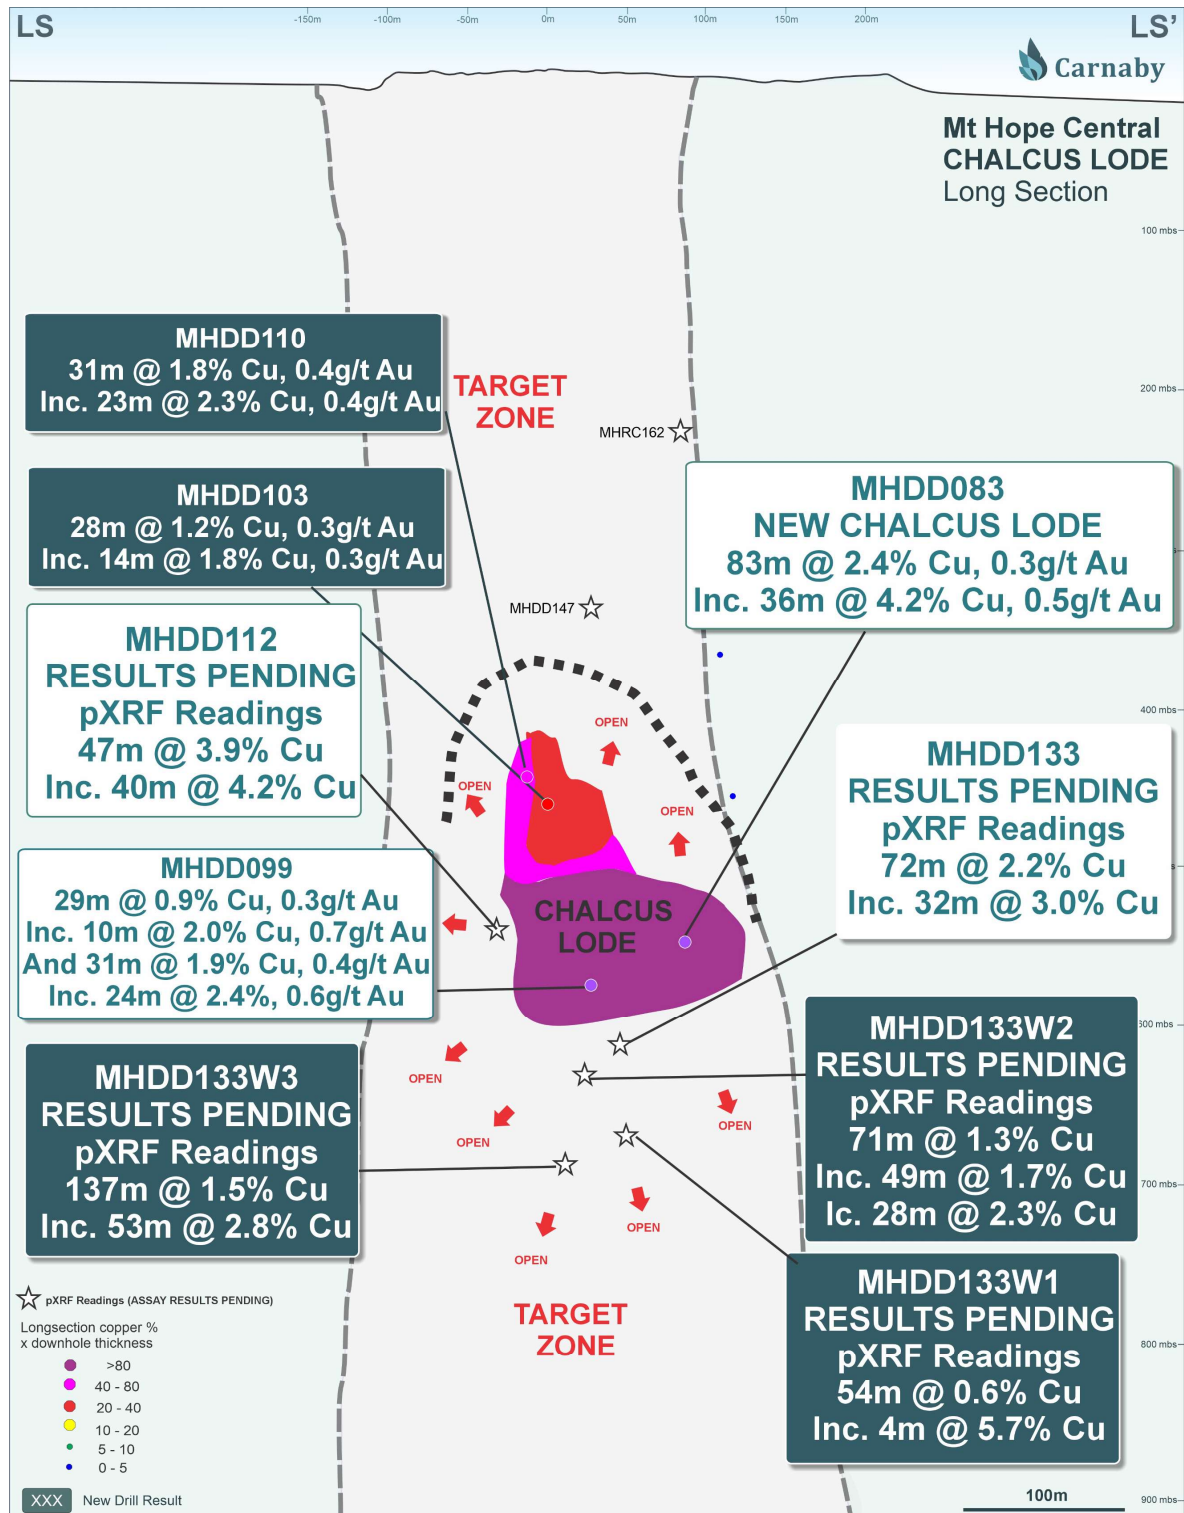

Figure 1. Mount Hope Central Chalcus Lodge Long Section Showing New Drill Results.

Three new diamond drill hole wedges (MHDD133W1-3) have been completed targeting the down dip location of the high grade Chalcus Lode discovery. All three holes intersected broad zones of copper gold mineralisation extending the Chalcus Lode and showing excellent continuity with the initial discovery drill holes (Figure 1). A spectacular intersection in MHD133W3 recorded pXRF readings of **137m @ 1.5% Cu** including **53m @ 2.8% Cu** is the deepest intersection yet on the Chalcus Lode.

Assay results were received from a further two intersections on the Chalcus Lode intersecting up to **31m @ 1.8% Cu, 0.4g/t Au** from 464m including **23m @ 2.3% Cu, 0.4g/t Au** from 469m. Results remain outstanding for several recent holes including the new pXRF intersections announced today.

The upper extent of the Chalcus Lode is yet to be delineated. Two new drill holes MHRC162 and MHDD147 were drilled targeting the up dip projection of the Chalcus Lode and did not intersect any significant mineralisation at the interpreted Chalcus Lode position however it is entirely possible that the Chalcus Lode could link up to the Boomerang Lode as shown in the drill section on Figure 2. Further drilling is planned to test this link position.

The Chalcus Lode discovery remains completely open in all directions and ongoing drilling continues to target the Chalcus lode and also a New Lode discovered in the footwall to the Chalcus Lode that was announced on 8 June 2023. Downhole EM will also be completed shortly to assist with targeting. Further drilling is required to delineate the extent and orientation of the Chalcus Lode and its location in relation to the Mining Lease boundary. The current interpretation is that the Chalcus Lode appears to bend around in a similar geometry to the Boomerang Lode and may cross the Mining Lease boundary between 900m and 1,000m below surface. However, if a steep west plunge is delineated as appears to occur on the Boomerang Lode then it is likely that the steep west plunge will result in the main body of the Chalcus Lode not crossing over the Mining Lease boundary. Only additional drilling will determine this.

Full assay and pXRF results and readings are presented in Table 1 & 2 of Appendix 1. Significant results are summarised as;

MHDD133W1 pXRF readings

Chalcus Lode	54m (TW~18m) @ 0.6% Cu from 629m
Including	4m (TW~1m) @ 5.7% Cu from 680m

MHDD133W2 pXRF readings

Boomerang Lode	4m (TW~1m) @ 5.2% Cu from 457m
Chalcus Lode	7m (TW~2m) @ 1.2% Cu from 552m

And Chalcus Lode 71m (TW~21m) @ 1.3% Cu from 618m

Including 49m (TW~14m) @ 1.7% Cu from 639m

MHDD133W3 pXRF readings

Chalcus Lode 137m (TW~37m) @ 1.5% Cu from 591m

Including 53m (TW~14m) @ 2.8% Cu from 670m

BOOMERANG & BINNA BURRA LODES

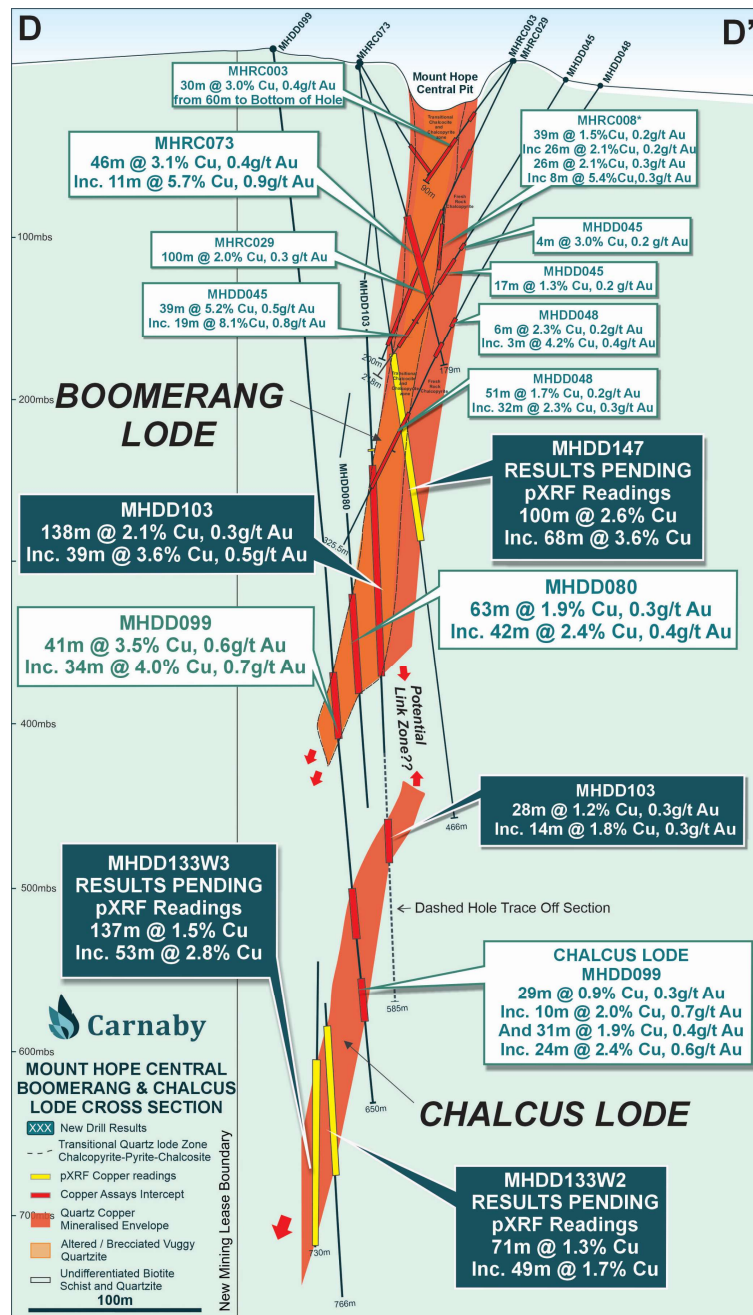

Figure 2. Cross Section Showing New Results from the Boomerang and Chalcus Lodes

Drilling continues to infill and extend the main Boomerang lode which remains strongly open at depth (Figure 2 & 3). Standout drill assay results include **138m @ 2.1% Cu, 0.3g/t Au** from 250m including **39m @ 3.6% Cu, 0.5g/t Au** from 263m in MHDD103 and pXRF readings from adjacent hole MHDD147 which recorded **100m @ 2.6% Cu** from 182m including **68m @ 3.6% Cu** from 182m.

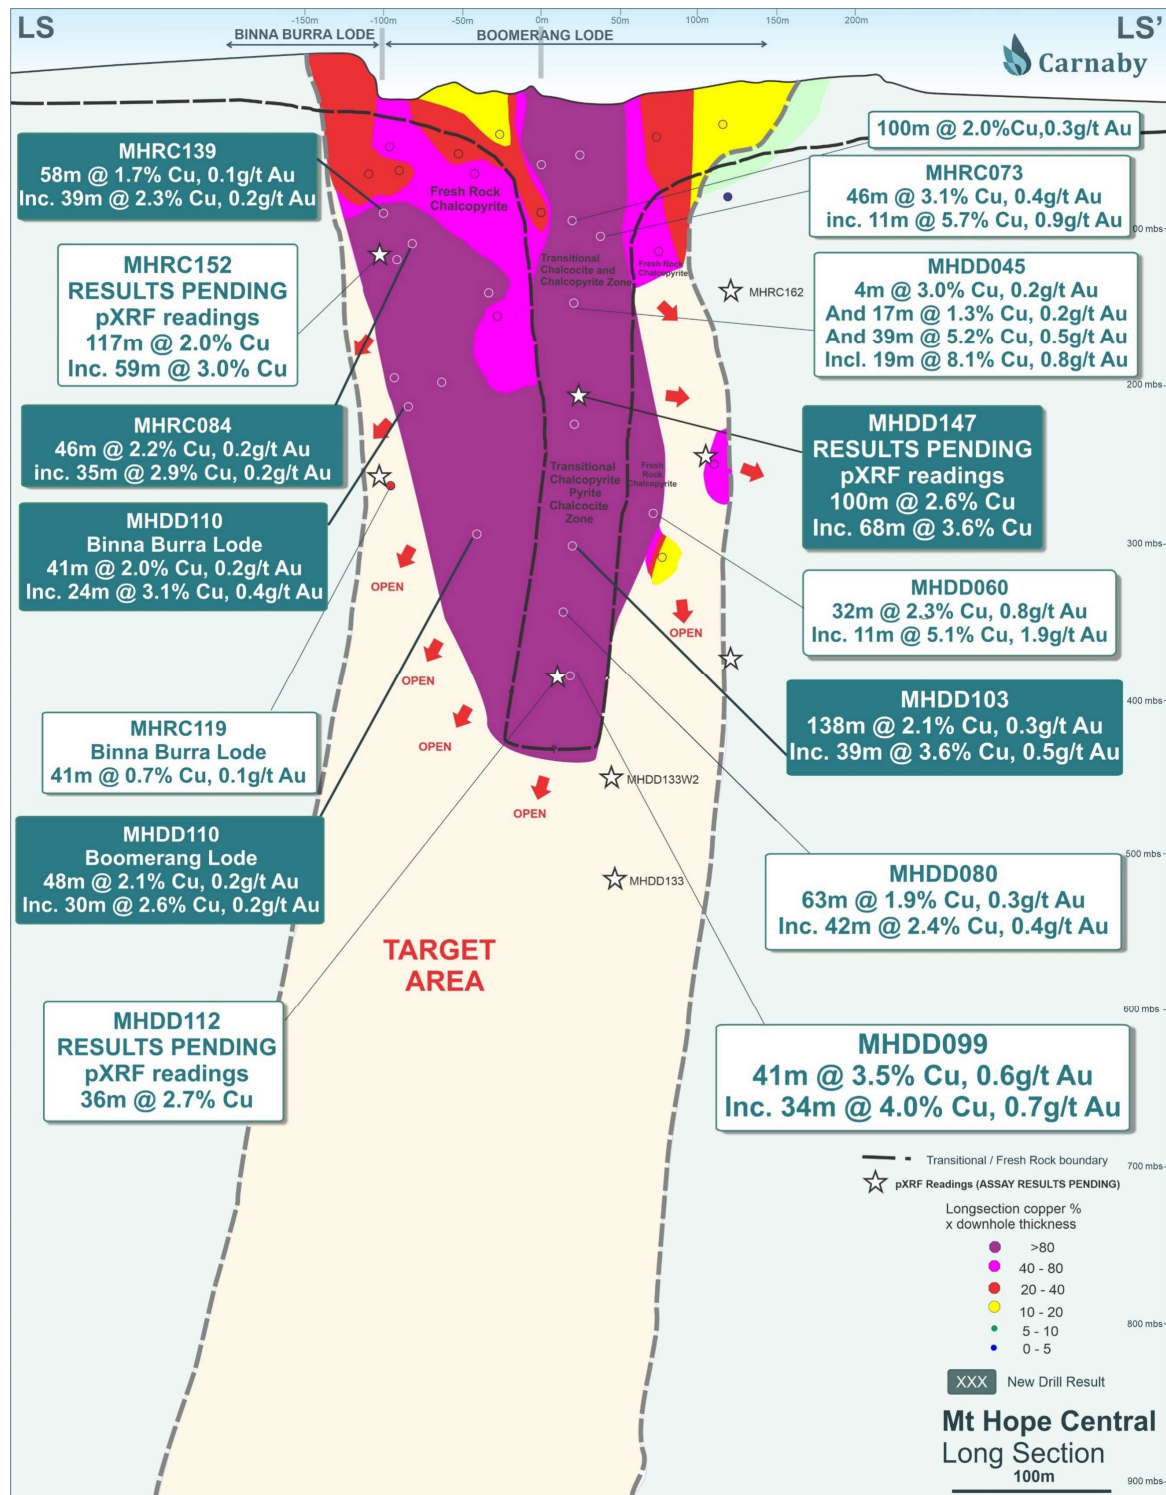

Figure 3. Mount Hope Central Boomerang Lode Long Section.

Ongoing drilling of the Boomerang Lode is currently focussed on the lower western section of the deposit which is completely open. As shown on the long section in Figure 3, the recent drilling indicates that the Boomerang Lode plunge appears to be shifting at depth to the west but remains steep. Further drilling is required to determine the exact location of the Boomerang Lode in terms of its proximity to the Mining Lease Boundary however the west plunge is considered favourable, and it remains likely that the steep west plunge will result in the main body of the Boomerang Lode not crossing over the Mining Lease boundary.

Full assay and pXRF results and readings are presented in Table 1 & 2 of Appendix 1. Significant results are summarised as;

MHDD103 Assays

Boomerang Lode	138m (TW~41m) @ 2.1% Cu, 0.3g/t Au from 250m
Including	39m (TW~12m) @ 3.6% Cu, 0.5g/t Au from 263m
And Chalcus Lode	28m (TW~8m) @ 1.2% Cu, 0.3g/t Au from 464m

MHDD110 Assays

Binna Burra Lode	8m (TW~3m) @ 1.1% Cu, 0.1g/t Au from 200m
And	41m (TW~17m) @ 2.0% Cu, 0.2g/t Au from 214m
Including	24m (TW~10m) @ 3.1% Cu, 0.4g/t Au from 231m
Boomerang Lode	48m (TW~15m) @ 2.1% Cu, 0.2g/t Au from 286m
Chalcus Lode	31m (TW~11m) @ 1.8% Cu, 0.4g/t Au from 464m
Including	23m (TW~8m) @ 2.3% Cu, 0.4g/t Au from 469m

MHRC084 Assays

Boomerang Lode	46m (TW~15m) @ 2.2% Cu, 0.2g/t Au from 109m
Including	35m (TW~11m) @ 2.9% Cu, 0.2g/t Au from 119m

MHRC139 Assays

Binna Burra Lode	58m (TW~12m) @ 1.7%, 0.1g/t Au from 101m
Including	39m (TW~8m) @ 2.3% Cu, 0.2g/t Au from 102m

MHRC139 Assays

Binna Burra Lode 58m (TW~12m) @ 1.7%, 0.1g/t Au from 101m

Including 39m (TW~8m) @ 2.3% Cu, 0.2g/t Au from 102m

MHDD147 pXRF readings

Boomerang Lode 100m (TW~34m) @ 2.6% Cu from 182m

Including 68m (TW~23m) @ 3.6% Cu from 182m

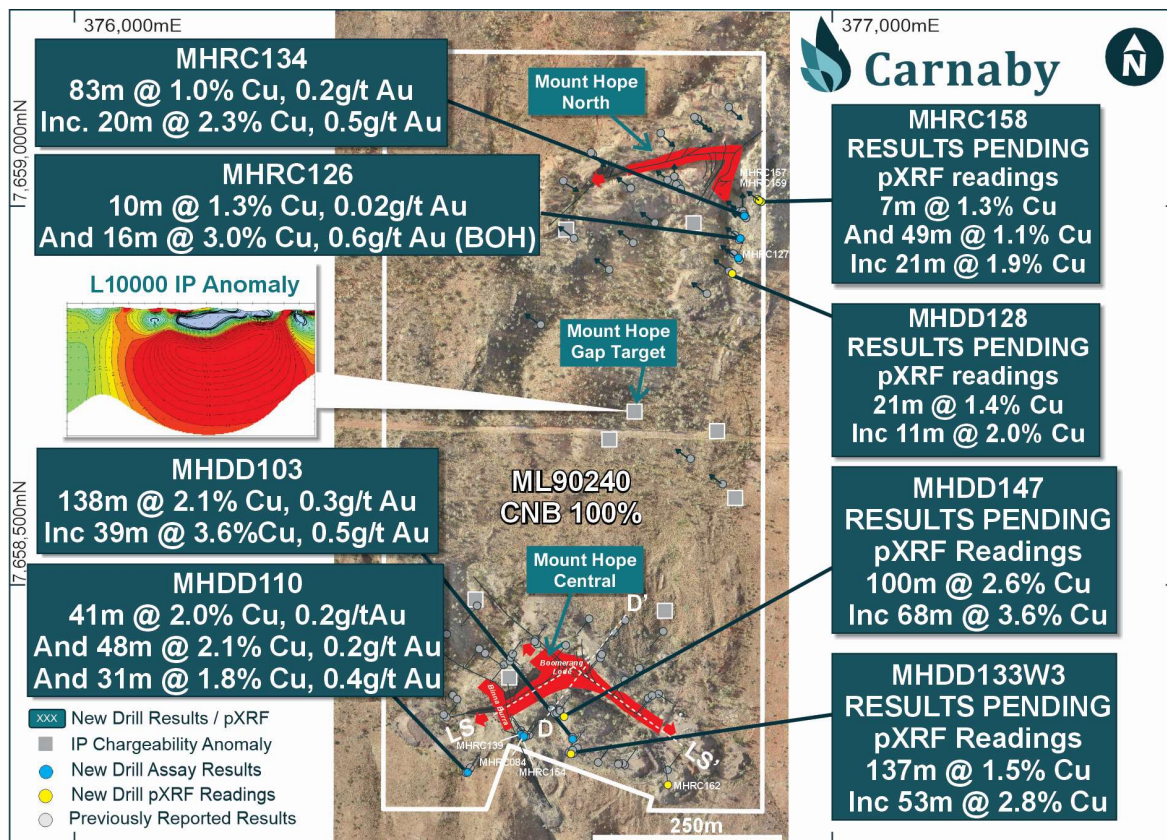

Figure 4. Mount Hope Mining Lease Drill Plan showing new results.

MOUNT HOPE NORTH PROSPECT (CNB 100%)

Drilling continues to intersect significant grades and widths of copper gold mineralisation at Mount Hope North, with new results including MHRC126 which intersected **16m @ 3.0% Cu, 0.6g/t Au** from 370m to bottom of hole (BOH) including **11m @ 4.0% Cu, 0.7g/t Au** from 375m to BOH. Of interest is that MHRC126 contained Chalcocite mineralisation and may be indicative of a core high grade zone as occurs in the transitional zone at Mount Hope Central.

A highly encouraging result was also received from MHRC134 which recorded **83m @ 1.0% Cu, 0.2g/t Au** from 138m including **34m @ 1.6% Cu, 0.4g/t Au** from 186m and **20m @ 2.3%**

Cu, 0.5g/t Au from 252m. Further drilling is required to determine the significance of this result as the mineralisation appears to be located in a new lode position.

Other significant results include a new three hole RC traverse at the north end of the deposit where all three holes intersected significant intersections of up to **49m @ 1.1% Cu** from 141m including **21m @ 1.9% Cu** from 167m.

Full assay and pXRF results and readings are presented in Table 1 & 2 of Appendix 1. Significant results are summarised as;

MHRC134 Assays

	83m @ 1.0% Cu, 0.2g/t Au from 138m
Including	34m @ 1.6% Cu, 0.4g/t Au from 186m
And Including	20m (TW~5m) @ 2.3% Cu, 0.5g/t Au from 252m

MHRC126 Assays

	10m (TW~3m) @ 1.3% Cu, 0.02g/t Au from 253m
And	16m @ 3.0% Cu, 0.6g/t Au from 370m BOH
Including	11m @ 4.0% Cu, 0.7g/t Au from 375m BOH

MHRC157 pXRF readings

	27m (TW~19m) @ 1.4% Cu from 105m
Including	7m (TW~5m) @ 2.2% Cu from 106m

MHRC158 pXRF readings

	7m (TW~3m) @ 1.3% Cu from 72m
And	49m (TW~25m) @ 1.1% Cu from 141m
Including	21m (TW~11m) @ 1.9% Cu from 167m

MHRC159 pXRF readings

	23m @ 1.4% Cu from 93m
Including	17m @ 1.8% Cu from 99m

MOUNT HOPE GAP PROSPECT (CNB 100%)

The Mount Hope Gap target remains a compelling target in the central part of the Mount Hope Mining Lease (Figure 4). The source of the very large and strong IP chargeability anomaly remains unexplained. Additional IP and downhole EM is about to commence targeting this anomaly to further refine the location and orientation of the chargeability anomaly prior to additional drill testing.

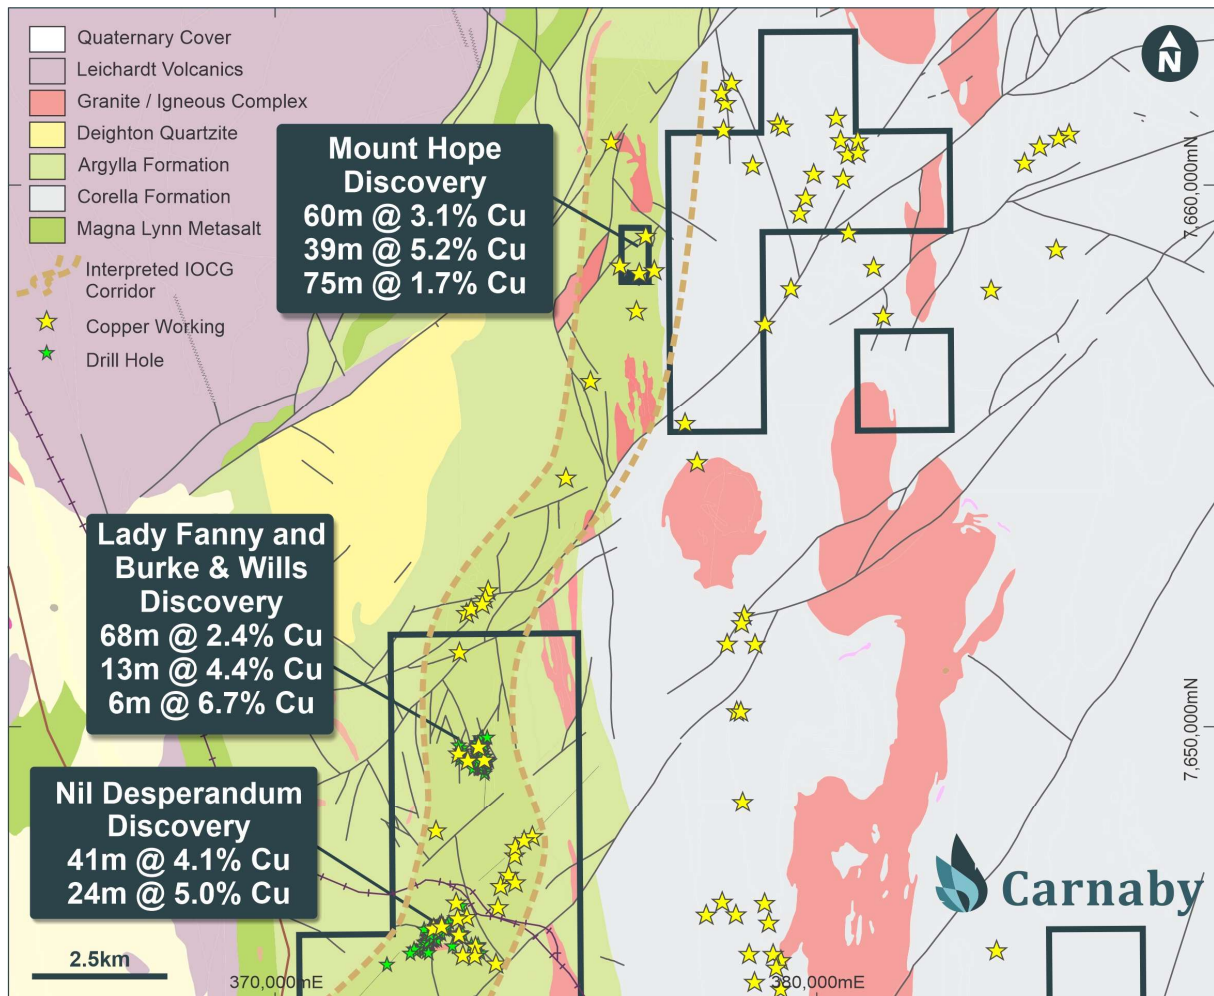

Figure 5. Mount Hope, Nil Desperandum and Lady Fanny IOCG corridor plan.

This announcement has been authorised for release by the Board of Directors.

Competent Person Statement

The information in this document that relates to exploration results is based upon information compiled by Mr Robert Watkins. Mr Watkins is a Director of the Company and a Member of the AUSIMM. Mr Watkins consents to the inclusion in the report of the matters based upon the information in the form and context in which it appears. Mr Watkins has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which is undertaken to qualify as a Competent Person as defined in the December 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (JORC Code).

Disclaimer

References may have been made in this announcement to certain ASX announcements, including references regarding exploration results, mineral resources and ore reserves. For full details, refer to said announcement on said date. The Company is not aware of any new information or data that materially affects this information. Other than as specified in this announcement and the mentioned announcements, the Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and, in the case of estimates of Mineral Resources, Exploration Target(s) or Ore Reserves that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

Recently released ASX Material References that relate to this announcement include:

¹ Interval 664.2 to 668.5m (4.3m) pXRF reading was not taken and pXRF weighted average applied to the full interval width.

^ Includes RC pre-collar pXRF readings, See ASX release dated 8 June 2023.

Table 2. pXRF Results

In relation to the disclosure of pXRF results, the Company cautions that estimates of sulphide mineral abundance from pXRF results should not be considered a proxy for quantitative analysis of a laboratory assay result. Assay results are required to determine the actual widths and grade of the visible mineralisation.

APPENDIX TWO

JORC Code, 2012 Edition | 'Table 1' Report Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as 	<ul style="list-style-type: none"> The RC drill chips were logged and visual abundances estimated by suitably qualified and experienced geologist.

Criteria	JORC Code explanation	Commentary
	<p>down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</p> <ul style="list-style-type: none"> • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> • Recent RC samples were collected via a cone splitter mounted below the cyclone. A 2-3kg sample was collected from each 1m interval. • Diamond core was half cut typically on 1m or less intervals within the mineralised zone. One half of the core sampled on the same side was submitted to the lab for analysis. • RC and diamond samples were submitted to ALS labs and pulverised to obtain a 25g charge. Ore grade analysis was conducted for Copper using an aqua regia digest and AAS/ ICP finish. Gold was analysed by aqua regia digest and ICP-MS finish. • pXRF measurements on RC chips were taken using a single reading through the calico bag for every metre. • pXRF results from drill core are averaged from spot readings taken directly on the core along each geologically determined interval.
Drilling techniques	<ul style="list-style-type: none"> • Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> • All recent RC holes were completed using a 5.5" face sampling bit. • Diamond holes in the current announcement were completed using HQ and NQ size core.
Drill sample recovery	<ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> • For recent RC and diamond drilling, no significant recovery issues for samples were observed. Occasional loss of sample was observed at the changeover metre interval from RC to diamond. • For diamond any core loss is recorded with core blocks denoting the start and end depth of the core loss interval. Triple tube was used to preserve friable/broken sections of HQ core in the transitional weathering horizon. • Drill chips collected in chip trays are considered a reasonable visual representation of the entire sample interval.
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> • RC holes have been logged for lithology, weathering, mineralisation, veining, structure and alteration. • Diamond holes logged in the same categories as RC with the addition of orientated structural measurements, density, magnetic susceptibility and conductivity. • All chips have been stored in chip trays on 1m intervals and logged in the field.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. 	<ul style="list-style-type: none"> • All RC samples are cone split at the cyclone to create a 1m sample of 2-3kg. The remaining sample is retained in a plastic bag at the drill site. • For mineralised zones, the 1m cone split sample is taken for analysis. For non-mineralised zones a 5m composite spear sample is collected and the individual 1m cone split samples over the same interval retained for later analysis if positive results are returned.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> Diamond core is half-sawn and sampled from one side only. The entire mineralised zone is sampled to account for any internal dilution. For RC chips, XRF readings were taken through the calico bag containing a representative 2-3kg split of material through the cyclone. pXRF results from drill core are averaged from spot readings taken directly on the core along each geologically determined interval. pXRF readings from both RC chips and diamond core are taken over the entire mineralised interval determined by geologist logging the drill hole. These readings extend for a few metres past the footwall and hangingwall contacts of the mineralised zone.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> For lab assays, company inserted blanks are inserted as the first sample for every hole. A company inserted gold standard and a copper standard are inserted every 50th sample. No standard identification numbers are provided to the lab. Field duplicates are taken in mineralised zone every 50th sample. Standards are checked against expected lab values to ensure they are within tolerance. No issues have been identified. pXRF results of RC chips were reported using an Olympus Vanta M Series portable XRF in Geochem mode (2 beam) and a 20 second read time for each beam. No calibration factors were applied. Based on comparisons of pXRF taken through the calico bag there is generally a reasonably close match between pXRF readings and lab assays. Lab Copper assays from diamond core samples are typically higher than their reported pXRF readings. pXRF readings were taken on different base metal standards every 50 readings. A blank pXRF reading was taken at the start of each hole.
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> Historic production data has been collated from government open file reports. A webhosted Maxgeo SQL database is currently in use for all historic and new records. The database is managed by an in-house database administrator. Recent results have been reported directly from lab reports and sample sheets collated in excel. Results reported below the detection limit have been stored in the database at half the detection limit – e.g., <0.001ppm stored as 0.0005ppm
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> All hole locations were obtained using a Trimble SP60 GPS in UTM MGA94. Current RC and Diamond holes were downhole surveyed by Reflex True North seeking gyro. Survey control is of high accuracy with periodic checks made between two different down-hole gyro instruments.
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of 	<ul style="list-style-type: none"> At Mt Hope further extensional and infill drilling is required to confirm the orientation and true width of the copper mineralisation intersected.

Criteria	JORC Code explanation	Commentary
	<p>geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</p> <ul style="list-style-type: none"> Whether sample compositing has been applied. 	
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Previous holes at Mt Hope are considered to intersect the mineralisation at a reasonable angle, being drilled at an orthogonal angle to the principal vein strike. More recent Mt Hope drill results typically have a true width approximately 1/3 of the down hole width. Recent drill holes in the Chalcus Lode intersect at a highly acute angle to the vein and estimated true width is significantly less than downhole width. Eg Estimated true widths for MHDD133W3 is 20% of the downhole width. Where known with reasonably certainty, the estimated true widths are quoted with the down hole widths.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> Recent RC drilling has had all samples immediately taken following drilling and submitted for assay by supervising Carnaby geology personnel.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> Not conducted

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section).

Criteria	Explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The Lady Fanny Prospect area encompassed by historical expired mining leases have been amalgamated into EPM14366 and is 100% owned by Carnaby. The Nil Desperandum, Shamrock, Burke & Wills and Lady Fanny South Prospects are located on EPM14366 (82.5% interest acquired from Discover Resources Limited (Discover, ASX: DCX)). Discover retain a 17.5% free carried interest in the project through to a Decision to Mine. At a Decision to Mine, Carnaby has the first right of refusal to acquire the remaining interest for fair market value. The Mount Hope Mining Lease ML90240 is 100% owned by Carnaby Resources.
Acknowledgment and appraisal of exploration by other parties.	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> There has been exploration work conducted over the Queensland project regions for over a century by previous explorers. The project comes with significant geoscientific information which covers the tenements and general region, including: a compiled database of 6658 drill hole (exploration and near-mine), 60,300 drilling assays and over 50,000 soils and stream sediment geochemistry results. This previous exploration work is understood to have been undertaken to an industry accepted standard and will be assessed in further detail as the projects are developed.

Criteria	Explanation	Commentary
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The prospects mentioned in this announcement are located in the Mary Kathleen domain of the eastern Fold Belt, Mount Isa Inlier. The Eastern Fold Belt is well known for copper, gold and copper-gold deposits; generally considered variants of IOCG deposits. The region hosts several long-lived mines and numerous historical workings. Deposits are structurally controlled, forming proximal to district-scale structures which are observable in mapped geology and geophysical images. Local controls on the distribution of mineralisation at the prospect scale can be more variable and is understood to be dependent on lithological domains present at the local-scale, and orientation with respect to structures and the stress-field during D3/D4 deformation, associated with mineralisation. Consolidation of the ground position around the mining centres of Tick Hill and Duchess and planned structural geology analysis enables Carnaby to effectively explore the area for gold and copper-gold deposits.
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. <p>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</p>	<ul style="list-style-type: none"> Included in report Refer to Appendix 2, Table 1.
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> No metal equivalent values have been reported. All reported intersections have Cu% weight averaged by sample interval length and reported by total downhole width of the intersection.
Average Relationship between mineralisation	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. 	<ul style="list-style-type: none"> Mt Hope intervals are reported as downhole width and true widths. Where true widths are not definitively known only downhole widths are reported.

Criteria	Explanation	Commentary
widths and intercept lengths	<ul style="list-style-type: none"> If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known'). 	<ul style="list-style-type: none"> Drill holes at Mt Hope are typically orientated orthogonal to the vein strike with down dip angles of intersection generally resulting in vein true widths approximately 1/3 of the down hole width. Recent drill holes in the Chalcus Lode intersect at a highly acute angle to the vein and estimated true width is significantly less than downhole width. Eg Estimated true widths for MHDD133W3 is 20% of the downhole width. Where known with reasonably certainty, the estimated true widths are quoted along with the down hole widths.
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> See the body of the announcement. The Mount Hope Central Long Section presented in Figure 4 represents a 2D vertical schematic illustration to show the overall distribution of copper gold mineralisation. Due to the complex shape of the deposit being an inclined boomerang geometry, it has been necessary to use an inclined plane to calculate the horizontal distance when calculating the NE lode pierce points in relation to the NW lode pierce points whereas the NW pierce points are determined directly onto a vertical plane. The long section is considered to represent actual strike and relative level positions of the mineralisation.
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> As discussed in the announcement
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> As discussed in the announcement
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> Planned exploration works are detailed in the announcement.
